## I. Introduction

The drafting of a patent claim is clearly more of an art than a science. The challenge exists in using language to describe invention. Quite often, in litigatory hindsight, the claims of a patent are not as precise as we had attempted to make them at the time of drafting. A colleague of mine recently commented on an amendment that I had just completed, and said: "great trees will be felled from forests to supply the paper which litigators will use to fight over what you mean by that." And in context, I reread my claim, and found it to be clear to me.

The interpretation of a claim is the linchpin of patent law. In a patent, the patentee is entitled to be their own lexicographer, thus, words may have an ordinary meaning, a particular meaning to the patentee or, as is often the case, a precise meaning attached to them by case law. Generally, there are two different types of infringement: literal infringement, and infringement under the doctrine of equivalents.

## 1. Literal Infringement

The language of a patent claim describes the metes and bounds of the invention protected by the patent. One who, without authority, makes, uses or sells a patented invention, during its term, infringes the patent. 35 U.S.C. § 271(a). Infringement of a patent claim is found where an accused device reads on the language of the patent claim. To read on the

1 Royal Typewriter Co. v. Remington Rand, 168 F.2d 691, 692

2. Infringement Under the Doctrine of Equivalents

device.  
fact determines whether an asserted patent reads on an accused  
of the patent claim is said to literally infringe. The finder of  
accused device. A device which literally reads on the language  
language of a claim, each claimed element must be present in the

Corp. v. Durand-Wayland, Inc., 833 F.2d 931, 937, 4 U.S.P.Q.2d

(BNA) 1737, 1741 (Fed. Cir. 1987) (in banc) cert. denied, 108

S.Ct 1226 (1988). This rule is used in conjunction with the

doctrine of equivalents, requiring all elements of the claimed

invention to be present in the accused device before a finding of

infringement lies.

It is axiomatic, however, that an element is not missing if

an equivalent has been substituted. Thus, infringement under the

doctrine of equivalents can only be found where all-elements of

the patent claim, or their substantial equivalent are present.

The term element may be used to mean a single limitation,

but it has also been used to mean a series of limitations which,

taken together, make up a component of the claimed invention. In

the all-elements rule, it is used in the sense of a limitation of

a claim. Corning Glass Works v. Sumitomo Electric U.S.A., Inc.,

868 F.2d 1251, 9 U.S.P.Q.2d (BNA) 1962 (Fed. Cir. 1989) "If a

claim limitation or its substantial equivalent is not present,

there can be no infringement." Julien v. Zeringue, 864 F.2d

1569, 1571, 9 U.S.P.Q.2d (BNA) 1552, 1553 (Fed. Cir. 1989).

It is important to note that claim limitations cannot be

ignored because the public is entitled to rely upon them to avoid

infringement. Pennwalt Corp., 833 F.2d at 935, 4 U.S.P.Q.2d at

1739.

## II. The Infringement Analysis

### 1. The Claim Requirements

Beginning with the Patent Act of 1836, an applicant for

patent was required to "particularly point out the part,

improvement, or combination, which he claims as his own invention or discovery." 1836 Patent Act, Ch. 357, 5 Stat. 117, Section 6.

(1836).

Essentially, the 1836 Act required the claiming of an

invention, such claims being the metes and bounds of the

invention. Accused devices which fall within these boundaries

are said to read on the patent, and literally infringe.

Conversely, accused devices which fall outside these boundaries

cannot literally infringe.

Today, a patent specification must end with one or more

claims particularly pointing out, and distinctly claiming the

subject matter which the applicant regards as his invention. 35

U.S.C. § 112, paragraph 2.

A claim may be written in independent or dependent form. 35

U.S.C. § 112, paragraph 3. A claim written in dependent form

incorporates by reference all the limitations of the claim from

which it depends. 35 U.S.C. § 112, paragraph 4. Thus, by

definition, if an accused structure infringes a dependent claim,

it must infringe the independent claim from which that dependent

claim depends.

It is worthwhile to take a moment and recognize that patent

law does not provide remedy for the number of claims which are

infringed by an accused structure, but instead for the number of

accused structures which infringe one or more claims. See

generally, 35 U.S.C. § 281, *et seq.* Thus, a claim depending from

another claim is of no immediate apparent value.

The dependent claim, however, has significant value. For

instance, where the parent claim is held invalid, the dependent

claim, which by definition includes further limitation, may still

be valid. But, another valuable use for the dependent claim

exists, because of the doctrine of claim differentiation, Hormone

Research Foundation, Inc. v. Genentech, Inc., 904 F.2d 1558, 15

U.S.P.Q.2d (BNA) 1039 (Fed. Cir. 1990) *cert. dismissed*, 111 S.Ct.

1434 (1991), -- which states that each claim should be presumed

to cover a different invention Laitram Corp. v. Rexnord, Inc.,

939 F.2d 1533, 19 U.S.P.Q.2d (BNA) 1367 (Fed. Cir. 1991) -- a

dependent claim may be used to help interpret what terms mean in

other claims in a patent. Kalman v. Kimberly-Clark Corp., 713

F.2d 760, 218 U.S.P.Q. 781 (Fed. Cir. 1983) *cert. denied*, 104

S.Ct 1284 (1984).

## 2. The Inquiries

Determination of patent infringement entails two inquiries:

the scope of the claim or claims; and whether the claims

encompass the accused structure. Texas Instruments, Inc. v.

United States Int'l Trade Comm'n, 805 F.2d 1558, 231 U.S.P.Q.

(BNA) 833 (Fed. Cir. 1986), aff'd, 846 F.2d 1369, 6 U.S.P.Q.2d (BNA) 1886, (Fed. Cir. 1988), rehearing en banc denied, 7 U.S.P.Q.2d (BNA) 1414 (Fed. Cir. 1988). This analytical framework applies whether the claims are asserted to be infringed literally, or by application of the doctrine of equivalents. Id.

(a) The Scope of the Claims

The true meaning of disputed claim language is determined by reference to the claims and the specification. Loctite Corp. v. Ultraseal Ltd., 781 F.2d 861, 867, 228 U.S.P.Q. 90, 93 (Fed. Cir. 1985). "It is entirely proper to use the specification to interpret what the patentee meant by a word or a phrase in the claim." E.I. Du Pont de Nemours & Co. v. Phillips Petroleum Co., 849 F.2d 1430, 1433, 7 U.S.P.Q.2d (BNA) 1129, 1131 (Fed. Cir. 1988). The importance of claim interpretation cannot be understated. It is only a properly interpreted claim that may be compared to an accused device, and [o]nce an interpretation has been made, that same interpretation must be employed in determining literal infringement and infringement under the doctrine of equivalents.

Senmed, Inc. v. Richard-Allan Medical Indus., 888 F.2d 815, 818, 12 U.S.P.Q.2d (BNA) 1508, 1511 (Fed. Cir. 1989). The question of patent infringement is therefore hinged upon the interpretation of the claims.

The seemingly clear question of infringement is often clouded by the interpretation of the language used in the claim. Claim interpretation is a question of law, and thus solely the

province of judicial interpretation. Proper interpretation of the claim is a prerequisite for a meaningful finding of infringement. In close cases, proper interpretation of claim language is often dispositive on the issue of literal infringement.

A Patentee, by definition being the first to invent an invention, is at a distinct advantage as they may claim all that they feels is the subject matter of their inventions. The patent examiner's function is, at least, to make sure that what is claimed is in fact patentable. The patentee then has the freedom to claim all they desire, limited only by their inventions and the prior art. See generally 35 U.S.C. § 102, and 35 U.S.C. § 103. It is for this reason that claims are read in light of the careful phraseology chosen by the inventors. Pennwalt Corp., 833 F.2d at 937, 4 U.S.P.Q.2d at 1741.

The drafter of the claim is faced with the inimical problem of creating a claim that will thwart future imitators who will possess knowledge not known at the time of drafting. Now couple the general frailty of language with the increasing complexity of patentable subject matter and it is difficult to conceive of a claim which could not be the subject of more than one reasonable interpretation. Nonetheless, the legal question -- the

interpretation of the claim -- must be determined as a condition precedent to any finding of infringement. And literal

"References to 'elements' can be misleading. 'Elements' often is used to refer to structural parts of the accused device or of a device embodying the invention. 'Elements' is also used in the phrase 'an element of a claim' in 35 U.S.C. § 112, paragraph 6. An element of an embodiment of the invention may be set forth in the claim . . . . It is the limitation of a claim that counts in determining both validity and infringement, and a limitation may include descriptive terms . . . . Because claims are composed of a number of limitations, the limitations have on occasion been referred to as 'claim elements' or 'elements of the claim,' but clarity is advanced when sufficient wording is employed to indicate when 'elements' is intended to mean a component of an accused device or of an embodiment of an invention and when it is intended to mean a feature set forth in or as a limitation in a claim." Perkin-Elmer Corporation v. Westinghouse Electric Corporation, 822 F.2d 1528; 3 U.S.P.Q.2D (BNA) 1321 (Fed. Cir. 1987) (Footnote 9). See also discussion in all-elements section, infra, regarding the differentiation between an element and a limitation.

Generally, a claim is for a combination, that is a combination of elements or limitations, which together comprise the patentable invention. It would certainly be hard to imagine

(b) Encompassing the Accused Structure

claimed invention is present in the accused device. Infringement is found only where each and every element of the

a claim for a mechanical device which consisted of a single

element. And a claimed combination contains no patented portion;

it is the combination which is patented. Porter v. Farmers

Supply Service, Inc., 790 F.2d 882, 229 U.S.P.Q. 814 (Fed. Cir.

1986).

To find infringement, an accused device must comprise every

limitation of the claim. Although there need not be a one-to-one

correspondence between the claim limitations and the elements of

the accused device. For example a single element in a device

could comprise two or more claim limitations. Likewise,

infringement is not avoided in an accused device by comprising a

single claim limitation only by a combination of device elements.

Similarly, the presence of additional of elements is

insufficient to overcome infringement. Data Line Corp. v. Micro

Technologies, Inc., 813 F.2d 1196, 1201, 1 U.S.P.Q.2D (BNA) 2052,

2055 (Fed. Cir. 1987). Even if the additional elements are

patentably distinct from the original invention, infringement

cannot be avoided.

It is the presence of each and every limitation in an

accused device leads to a finding of infringement.

### III. Equivalents - The Doctrine of Equivalents

If literal infringement is not found, the courts have used

their equitable powers to find infringement under the doctrine of

equivalents. The doctrine of equivalents is designed to do

equity, and to relieve an inventor from a semantic strait jacket

railroad cars infringed. This was based upon the sum of the load. The Supreme Court held that octagonal and pyramidal shaped in the form of a frustum of a cone to provide balance to the coal transporting coal. The patent claimed a car having a body shaped

(b) Graver Tank the Current Precedent

In 1950 the Supreme Court again recognized that the

infringement inquiry is directed to whether there has been a

pirating of the invention. Graver Tank, 339 U.S. 605, 85

U.S.P.Q. 328. The Court determined that a patentee should not be

deprived of the benefits of his patent by competitors who

appropriate the essence of the invention while barely avoiding

the literal language of the claims. See Laitram Corp. v.

Cambridge Wire Cloth Co., 863 F.2d 855, 856-57, 9 U.S.P.Q.2d

(BNA) 1289, 1291 (Fed. Cir. 1988), cert. denied, 490 U.S. 1068,

109 S.Ct. 2070, 104 L. Ed. 2d 635 (1989) Accordingly, the

modern incarnation of the doctrine of equivalents emerged.

Although designing or inventing around patents to make new

inventions is encouraged, piracy is not. Thus, where an

infringer, instead of inventing around a patent by making a

substantial change, merely makes an insubstantial change,

essentially misappropriating or even "stealing" the patented

invention, infringement may lie under the doctrine of

equivalents. Wallace London v. Carson Pire Scott & Co., 946

F.2d 1534, 20 U.S.P.Q.2d (BNA) 1456 (Fed. Cir. 1991) (citing

Graver Tank, 339 U.S. at 609-10, 85 U.S.P.Q. (BNA) at 331;

Lockheed Aircraft Corp. v. United States, 213 Ct.Cl. 395, 553

F.2d 69, 82, 193 U.S.P.Q. (BNA) 449, 461 (1977)).

As stated by Learned Hand, the doctrine is invoked "[t]o

temper unsparing logic and prevent an infringer from stealing the

benefit of an invention . . .", Royal Typewriter Co. v. Remington  
Rand, 168 F.2d 691, 692, "[a] patentee may invoke this doctrine  
to proceed against a producer of a device 'if it performs  
substantially the same function in substantially the same way to  
obtain the same result.' Sanitary Refrigerator Co. v. Winters,  
280 U.S. 30, 42." Graver Tank, 339 U.S. at 608.

Realizing that the term "equivalency" is rather amorphous  
terminology which evaded ready definition, the Graver Tank Court  
stated that:

[w]hat constitutes equivalency must be determined  
against the context of the patent, the prior art, and  
the particular circumstances of the case. Equivalency,  
in the patent law, is not the prisoner of a formula and  
is not an absolute to be considered in a vacuum.

339 U.S. at 608.

Equivalency is necessarily determined on a case by case  
basis, and almost by definition cannot be the subject of a  
discrete set of rules whereby it can be properly determined.  
Instead, the equitable doctrine is considered de novo in each  
equivalency determination. The Court struggled with defining the  
term equivalency itself:

[Equivalency] does not require complete identity for  
every purpose and in every respect. In determining  
equivalents, things equal to the same thing may not be  
equal to each other and, by the same token, things for  
most purposes different may sometimes be equivalents.

339 U.S. at 608.

Realizing the inherent ambiguity in determining equivalency,  
such ambiguity quite possibly exacerbated by their own

a matter of course.

cautioned against the assertion of the doctrine of equivalents as

2. Perkin-Elmer Corp. v. Westinghouse Elec. Corp.

In Perkin-Elmer Corp. v. Westinghouse Elec. Corp., 822 F.2d 1528, 3 U.S.P.Q.2d (BNA) 1321 (Fed. Cir. 1987), the appellate dispute centered around two clauses, (e.g. limitations), of the claim which represented "tap coupling". The defendant's accused device, however, employed "loop coupling".

The Court of Appeals for the Federal Circuit cited Lemelson v. United States, 752 F.2d 1538, 1551, 224 U.S.P.Q. (BNA) 526, 533, (Fed. Cir. 1985), for the proposition that "each element of a claim is material and essential, and for a court to find infringement, the plaintiff must show the presence of every element or its substantial equivalent in the accused device."

The Court went on, however, to say [t]o be a "substantial equivalent," the element substituted in the accused device for the element set forth in the claim must not be such as would substantially change the way in which the function of the claimed invention is performed.

Perkin-Elmer Corp., 822 F.2d at 1533, 3 U.S.P.Q.2d (BNA) 1321. The Court pointed out that there is dicta that suggests that consideration of the "essence", "gist" or "heart" of the invention may be helpful in determining infringement under the doctrine of equivalents in Loctite Corp., 781 F.2d 861, 228 U.S.P.Q. 90 and Atlas Powder Co. v. E.I. Du Pont de Nemours & Co., 750 F.2d 1569, 1582, 224 U.S.P.Q. (BNA) 409, 418 (Fed. Cir.

1985) (both citing Medtronics, Inc. v. Cardiac Pacemakers, Inc., 721 F.2d 1563, 1567, 220 U.S.P.Q. (BNA) 97, 101 (Fed. Cir. 1983)). The Court pointed out, however, that that dicta may not be read as implying that specific claim limitation can be ignored as insignificant or immaterial in determining infringement.

Instead, the Court noted that it must be read as shorthand for the considerations set forth in Graver Tank, i.e., that the infringer should not appropriate the invention by making substitutions for those limitations, when the substitutions do not substantially change the function performed, or the way it is performed by the invention. Perkin-Elmer Corp., 822 F.2d 1528, n.9, 3 U.S.P.Q.2d (BNA) 1321 n.9. The Court rejected the plaintiff's argument that the claim could be read as a "coupler" instead of a "tap coupler", specifically in light of the lack of explanation of why it was not claimed that way.

Infringement, literal or under the doctrine of equivalents, requires that every limitation of a claim be met literally or by a substantial equivalent. Intellical Inc. v. Phonometrics Inc., 21 U.S.P.Q.2d (BNA) 1383, 1387 (Fed. Cir. 1992); Key Mfg. Group, Inc. v. Microdot, Inc., 925 F.2d 1444, 1449, 17 U.S.P.Q.2d (BNA) 1806, 1810 (Fed. Cir. 1991); Johnson v. limitation. This question, however, is not without any

accused device is a substantial equivalent of the claim

combination to be expressed as a means for performing a function. Now, an element may be claimed through the use of

*means-plus-function* language. The Patent Act at 35 U.S.C. § 112, paragraph 6, specifically permits an inventor to claim: [a]n element in a claim for a combination . . . as a means or step for performing a specified function without the recital of structure, material, or acts in support thereof . . . .

35 U.S.C. § 112, paragraph 6. (It is, however, difficult to

imagine a single element claim in, for instance, the mechanical arts, let alone a single element claim claimed as a means for

performing a function, thus the limitation to combination claims is, in general, just common sense.)

In answer to the Court's articulated concern, (See

Halliburton, 329 U.S. 1), that such language was overbroad and

ambiguous, Congress provided specifically how such language was to be interpreted. Congress detailed the precise statutory

reach, or interpretation, of claim language so written, thus the statute provides:

[a *means-plus-function*] claim shall be construed to cover the corresponding structure, material, or acts described in the specification and **equivalents** thereof. [emphasis supplied]

35 U.S.C. § 112, paragraph 6. In Penwalt, this Court clearly stated that:

section § 112 paragraph 6 rules out the possibility that any and every means which performs the function specified in the claim literally satisfies that limitation.

Pennwalt Corp., at 934, 4 U.S.P.Q.2d at 1739. That is, § 112 operates as a restriction to the literal satisfaction of the claims. Id.

Of course, not all embodiments of each element must exist in the specification. In other words, the law cannot be construed to require that an applicant describe in his specification, every conceivable and possible future embodiment of his invention.

Texas Instruments, Inc. v. United States Int'l Trade Comm'n, 805 F.2d 1558, 231 U.S.P.Q. 833. It is clear that a

*means-plus-function* claim can be construed to cover, not only the embodiments (of each element) disclosed in the specification, but their *statutory equivalents* as well.

In summary, the reach of a *means-plus-function* element (in a literal infringement analysis) extends beyond that which is

disclosed in the specification, yet it is limited by the statute to less than all which its words literally encompass.

1. 35 U.S.C. § 112, paragraph 6

The 1952 Patent Act, 35 U.S.C. §§ 1-376 as amended, states that "[t]he specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject

matter which the applicant regards as his invention." 35 U.S.C. § 112, paragraph 2. Generally a claim should contain "(1) a

preamble . . . , (2) a phrase such as 'wherein the improvement comprises,' and (3) and those elements, steps and / or

relationships which constitute that portion of the claimed

combination which the applicant considers as the new or improved portion." 37 C.F.R. § 1.75(e). There is no specific rule as to the language or format of claims, a claim may be written in a plethora of differing yet equally correct forms.

2. *An Example of Means-Plus-Function Language*

Among the forms in which a claim may be presented, is the so called *means-plus-function* form. Unlike other claim formats, 35 U.S.C. § 112, paragraph 6 specifically provides for the *means-plus-function* element of a claim.

As an example of the means plus function language consider the following sample claim element in a hypothetical claim for a digital thermometer: "an LCD display that displays temperature." This a claim element could not be literally infringed by, for instance, a mercury thermometer.

Contrast that with the following *means-plus-function* claim language: "means for temperature display" -- the language of which suggests that it literally extends to all means for performing the stated function. That is, however, simply not the case. Quite the contrary, the claim comprising this element would extend only to means for temperature display possessing structures that are the *statutory equivalent* of those structures for temperature display found in the specification.

In other words, "section 112, paragraph 6, rules out the possibility that any and every means which performs the function specified in the claim literally satisfies that limitation."

Pennwalt Corp., 833 F.2d at 934, 4 U.S.P.Q.2d (BNA) 1737.

Although encompassing equivalents of structures disclosed in the specification, the provision of paragraph 6, nevertheless, acts as a restriction on the literal satisfaction of a claim

limitation. Id. (citing Data Line Corp., 813 F.2d at 1201, 1 U.S.P.Q.2d at 2055) Properly understood § 112, paragraph 6

operates more like the reverse doctrine of equivalents<sup>7</sup> than the doctrine of equivalents because it restricts the scope of the

literal claim language. Johnston v. IVAC Corp., 885 F.2d 1574, 12 U.S.P.Q.2d (BNA) 1382 (Fed. Cir. 1989).

To properly determine what is encompassed by a § 112,

paragraph 6 claim element, the statute directs us to the

specification. The claim, and therefore the element, is

"construed to cover the corresponding structure, material, or

acts described in the specification and equivalents thereof."<sup>8</sup>

<sup>7</sup> The reverse doctrine of equivalents, although never upheld

as a basis for a finding of non-infringement in the Court of

Appeals for the Federal Circuit, stand for the proposition that

even if an accused device read on the literal language of the

claim, it may be so far changed in principal from the original

device that a finding of infringement could not equitably lie.

<sup>8</sup> Rich, J., Address before the New York Patent Law Association

(November 6, 1952), reprinted in R. Calvert, The Encyclopedia of

Patent Practice and Invention Management 17, "Section 112 --

In order to meet a means-plus-function limitation literally,

an accused device must (1) perform the identical function claimed

for the means element, and (2) perform that function using the

structure disclosed in the specification or an equivalent

structure. Intel Corp. v. U. S. Int'l Trade Comm'n, 946 F.2d

821, 20 U.S.P.Q.2D (BNA) 1161 (Fed. Cir. 1991); Pennwalt, 833

F.2d at 934, 4 U.S.P.Q.2d at 1739; see also Laitram Corp., 939

F.2d 1533, 19 U.S.P.Q.2d at 1369-70; Durango Assocs., Inc. v.

Reflange, Inc., 843 F.2d 1349, 1357, 6 U.S.P.Q.2D (BNA) 1290,

1295 (Fed. Cir. 1988). In short, identity of function,

equivalents of structure.

If the required function is not performed exactly in the

accused device, § 112, paragraph 6 is not involved. See, e.g.,

Intel Corp., 946 F.2d 821, 20 U.S.P.Q.2D (BNA) 1161.

The interpretation of a § 112, paragraph 6 claim may not be

performed absent a detailed look at the specification. First,

the structure or structures disclosed in the specification, which

carry out the stated function, must be identified. Next, the

accused device is reviewed to determine which, if any, structures

carry out the stated function. Only after the accused structure

Means Claims" (1964).

Note that the law imposes no requirement that there be a one

to one correspondence between structures in the accused device

and elements in the claim. It is possible that the accused

and the disclosed structure are identified, can the court determine whether these structures are equivalent -- and if so, that the element is literally present in the accused device. In other words, if the accused device carries out the identical function as the one disclosed in the claim element, using a structure equivalent to one disclosed in the specification for carrying out the function described in the claim element, then the claim element is literally present in the accused device. And, where all claim elements are literally present, literal infringement is found. Where a claim comprising means-plus-function elements is compared to an accused device, and the element is found not to be present, then either: (i) the accused device does not perform the identical function; or alternately, (ii) the accused device, in fact, performs the identical function, but does not use an equivalent in so doing. As an example, assume that a claims elements comprise A, B, and a means for X; and the specification only discloses C as the structure to carry out the function X. Further, assume the accused device comprises A, B, and a means for X; but the structure which carries out X is D. Then the proper inquiry, as to whether there is literal infringement, is simply whether C is device have a single structure which carries out many functions recited in the claim. Conversely, it is possible that a multiplicity of structures in the accused device, together, to carry out a single recited function.

equivalent to D -- if so, literal infringement can be found; if not there can be no finding of literal infringement.

Of course, rarely is the a matter as clearly framed as the above example. Often, multiple *means-plus-function* elements

differ from the claimed invention to the accused device. When that is the case, as the court in Texas Instruments, Inc. v. United States Int'l Trade Comm'n, 805 F.2d 1558, 231 U.S.P.Q.

(BNA) 833, so aptly noted, the equivalency of each changed means is appropriately determined in light of the other structural

changes in the combination. To evaluate each changed means as if it were the only change in the accused device would distort the

process and evaluate a theoretical device made up of all but one of the patentee's disclosed structure. That is not the standard. Of course, the court provided no guidance as to how it was able

to apply this unwieldy standard and determine each change in

light of all of the others. Instead, the court merely summarized the changes, and then stated: "[t]aken together, these

accumulated differences distinguish the accused [devices] from

that contemplated in the [] patent and transcend a fair range of equivalents of the [] invention." Texas Instruments, Inc., 805 F.2d at 1570, 231 U.S.P.Q. (BNA) 833.

Simply put, a *means-plus-function* element is literally

infringed if there is identity of function and equivalents of

structure.

3. Method Claims and Statutory Equivalents

It is worth mention that § 112, paragraph 6 reads on

combination method claims as well as on apparatus claims. Of

course, the above discussion related almost exclusively to

apparatus claims because there is no case law applying § 112,

paragraph 6 to method claims. However, the statute expressly

states that a claim may be expressed as a:

step for performing a specified function without the  
recital of ... acts in support thereof, and ... shall  
be construed to cover the corresponding ... acts  
described in the specification and equivalents thereof.

35 U.S.C. § 112, paragraph 6

It is hard to imagine that method claims generally recite

sufficient acts within each element so that they would not be

subject to a § 112, paragraph 6 interpretation. Yet in my review

of case law, I have not found § 112, paragraph 6 applied to

method claims.

What is most surprising is that many claim drafters,

artisans in their own right, write parallel claims, in both

apparatus and method form to cover the same invention in varying

ways. Consider the following:

An apparatus comprising:

means for X;

means for Y; and

means for Z.

The means of this claim are limited to the structures (and their

statutory equivalents) disclosed in the specification for

carrying out the functions X, Y and Z. Were the application

patent only a thermal printer was disclosed, but the accused at 1568. At issue, *inter alia*, was a display means. In the performed the function stated in the claims. Texas Instruments (BNA) 833 there was no question as to whether the accused devices In *Texas Instruments, Inc.*, 805 F.2d 1558, 231 U.S.P.Q.

(a) *Texas Instruments v. United States Int'l Trade Comm'n* is here, where the case law seems to have no clear cut guidance. It decide whether the element in the accused device is the statutory course, once "what" to compare has been determined, we must in *means-plus-function* form according to § 112, paragraph 6. Of "what" to compare for statutory equivalents in an element written Up to this point the focus has been upon determining the

Graver Tank dicta cited above, however, it allows a hundred years of law on equivalents to be read into the meaning of the word

equivalents in 35 U.S.C. § 112, paragraph 6.

On rehearing, the concurring opinion of Davis, J., most

aptly noted the "symbiosis" between § 112 "equivalents" and the

doctrine of equivalents -- "both spring from the same roots and

very often take account of the same factors and considerations."

A rehearing en banc was denied.

While stressing the distinctiveness of each of the separate

doctrines, the Court of Appeals for the Federal Circuit, in

Palumbo v. Don-Joy Co., 762 F.2d 969, 975 n.4, 226 U.S.P.Q. 5,

8-9 n.4 (Fed. Cir. 1985) declared that Graver Tank concepts of

equivalents are relevant in any 'equivalents' determination under

§ 112, and the underlying principals of equivalents in Graver

Tank could be used in a § 112 literal infringement, e.g.

statutory equivalents, analysis. See also Lockheed Aircraft

Corp. v. United States, 553 F.2d 69, 193 U.S.P.Q. (BNA) 449

(Ct.Cl. 1977).

(b) Valmont Industries Inc. v. Reinke Manufacturing Co., Inc.

To determine whether a particular structure for carrying out

the claimed function is a statutory equivalent (e.g. the § 112,

paragraph 6 sense) the courts have turned to the familiar

tripartite test, and/or used the tradition notion of equivalents,

both with over one hundred years of case law behind it. The

three judge panel in Valmont Industries Inc. v. Reinke

The Valmont Court finds that § 112 and the doctrine of

equivalents have one thing in common, the word equivalent. While

demonstrating a clear understanding of the § 112, paragraph 6

analysis, the Court, lead by an apparently confused Raider, J.,

states: "[a] determination of section 112 equivalents does not

involve the equitable tripartite test of the doctrine of

equivalents." Although the Court purports to be clear on what

statutory equivalents is not, it provides no guidance for what it

is, except: "comparison of these two control means compels the

conclusion that the claimed control means and [defendant's]

control means are not structurally equivalent under section 112."

Despite itself, the Valmont Court reached the proper result.

The ramifications of this decisions should be mitigated by

the fact that it was merely a three judge panel. Although it is

doubtless that, until overruled, it will be cited, maybe for

years to come, for the proposition that statutory equivalents is

not even a distant cousin of the doctrine of similar ilk.

## VI. Equivalents, Equivalents or Equivalents.

There are a few things which are troublesome about the

equivalents problems. First, the courts have managed to build

reasoning upon itself. Take, for example, the following logic.

To prove that an accused device infringes a claim under the

doctrine of equivalents, a patentee can prove: that the accused

device performs substantially the same function, in substantially

the same way, to achieve substantially the same result.

But how do we know when these are substantially equivalent?

That's easy, the courts have provided guidance. We can look

to the function which it is intended to perform; or the qualities

it has when combined with the ingredients.

Specifically, the courts have relied on whether there was a

known interchangeability to determine whether the way prong is

met.

This would suffice, but for the courts statement in Corning

that:

Although each claim limitation may not literally be found in the accused structure, the 'substantially the same way' prong of the Graver Tank test is met if an equivalent of a recited limitation has been substituted in the accused device, see Graver Tank, 339 U.S. at 610; see also, Bennwalt Corp. v. Durand-Wayland, Inc., 833 F.2d 931, 937, 4 U.S.P.Q.2d 1737, 1741 (Fed. Cir. 1987) (in banc) cert. den. 485 U.S. 961 (1988); Perkin-Elmer Corp., 882 F.2d at 1533, 3 U.S.P.Q.2d at 1325; Atlas Powder Co. v. E.I. Du Pont de Nemours & Co., 750 F.2d 1569, 1579-80, 224 U.S.P.Q. 409, 416 (Fed. Cir. 1984).

Corning Glass Works, 868 F.2d at 1259, 9 U.S.P.Q.2d (BNA) 1962.

Thus using the concept of equivalents to meet the way prong of

the test to meet the test of the doctrine of equivalents. Could

one then determine that the recited limitation were an equivalent

by using the tripartite test?

This is merely an example of the frailty of language.

Notwithstanding the obvious shortcomings of attempting to define inventions -- and for that matter trying to define equivalents -- with mere language, a substantial question arises from this research. That is: if a proper § 112, paragraph 6 analysis has been performed on an element of a claim, and that element, and therefore literal infringement has been found not to exist, then, can that device ever be found to infringe under the doctrine of equivalents, in light of the all elements rule? That requires some further detailed analysis. First, assume that there is a claim for a combination wherein all of the elements but one are admitted to exist in the accused device. Then assume that the element not admitted is written in *means-plus-function* form. Further, assume that after a proper analysis under § 112, paragraph 6, this element is found not to literally exist in the accused device because the structures which carries out the function is not identical, nor equivalent to those structures disclosed in the specification (structural non-equivalents). Can the element still have a substantial equivalent in the accused device?

Although equivalents in any usage is ill-defined, in the case (above) of structural non-equivalents, the answer must be a clearly resounding no. Thus, a finding that the structure (or its equivalent) of a *means-plus-function* claim element is not present in an accused device should preclude any inquiry under the doctrine of equivalents. This results because if the

equivalent of the structure is not present, then the substantial equivalent of the limitation cannot be. Further, no cases which have reached the Federal Circuit have had findings contrary to this conclusion.<sup>10</sup>

Consider a similar scenario, where the only element not admitted to exist in the accused device is in means-plus-function form. This time the § 112, paragraph 6 analysis finds that the accused device does not carry out the identical function (functional non-identity). Can the element still have a substantial equivalent in the accused device?

Although the courts make a big to do about the requirement that the function be identical, this seems to miss the point entirely. A function is either carried out, or it is not.

---

<sup>10</sup> Sun Studs, Inc. v. ATA Equipment Leasing, Inc., 872 F.2d 978, 10 U.S.P.Q.2d (BNA) 1338 (Fed. Cir. 1989), under less than ordinary circumstances, was remanded to consider the doctrine of equivalents without a concurrent reversal of the finding of no literal infringement on § 112, paragraph 6 elements. There was a jury finding of literal infringement, and in the alternative, infringement under the doctrine of equivalents. The trial judge granted the defendants motion for a judgment n.o.v. and ruled that there was no infringement. It is notable, however, that the plaintiff did not press the issue of literal infringement, and thus the courts review and therefore its remand, was limited to the doctrine of equivalents.
