CRS Report for Congress

Prepared for Members and Committees of Congress

R11173008

Summary

Navigating the Internet requires using addresses and corresponding names that identify the location of individual computers. The Domain Name System (DNS) is the distributed set of databases residing in computers around the world that contain address numbers mapped to corresponding domain names, making it possible to send and receive messages and to access information from computers anywhere on the Internet.

The DNS is managed and operated by a not-for-profit public benefit corporation called the Internet Corporation for Assigned Names and Numbers (ICANN). Because the Internet evolved from a network infrastructure created by the Department of Defense, the U.S. government originally owned and operated (primarily through private contractors) the key components of network architecture that enable the domain name system to function. A 1998 Memorandum of Understanding (MOU) between ICANN and the Department of Commerce (DOC) initiated a process intended to transition technical DNS coordination and management functions to a private-sector not-for-profit entity. While the DOC has played no role in the internal governance or day-to-day operations of the DNS, ICANN remained accountable to the U.S. government through the MOU, which was superseded in 2006 by a Joint Project Agreement (JPA). On September 30, 2009, the JPA between ICANN and DOC expired and was replaced by an Affirmation of Commitments (AoC), which provides for review panels to periodically assess ICANN processes and activities.

Many of the technical, operational, and management decisions regarding the DNS can have significant impacts on Internet-related policy issues such as intellectual property, privacy, e-commerce, and cybersecurity. With the expiration of the ICANN-DOC Joint Project Agreement on September 30, 2009, and the announcement of the new AoC, the 112th Congress and the Administration may continue to assess the appropriate federal role with respect to ICANN and the DNS, and examine to what extent ICANN is positioned to ensure Internet stability and security, competition, private and bottom-up policymaking and coordination, and fair representation of the global Internet community. A related issue is whether the U.S. government's unique authority over the DNS root zone should continue indefinitely. Foreign governments have argued that it is inappropriate for the U.S. government to have exclusive authority over the worldwide DNS, and that technical coordination and management of the DNS should be accountable to international governmental entities. On the other hand, many U.S. officials argue that it is critical for the U.S. government to maintain authority over the DNS in order to guarantee the stability and security of the Internet.

The expiration of the JPA, the implementation of the Affirmation of Commitments, and the continuing U.S. authority over the DNS root zone remain issues of interest to the 112th Congress, the Administration, foreign governments, and other Internet stakeholders worldwide. Other specific issues include the possible addition of new generic top-level domain names (gTLDs), .xxx and the protection of children on the Internet, the security and stability of the DNS, and the status of the WHOIS database. How all of these issues are ultimately addressed could have profound impacts on the continuing evolution of ICANN, the DNS, and the Internet.

Background and History

The Internet is often described as a “network of networks” because it is not a single physical entity but, in fact, hundreds of thousands of interconnected networks linking many millions of computers around the world. Computers connected to the Internet are identified by a unique Internet Protocol (IP) number that designates their specific location, thereby making it possible to send and receive messages and to access information from computers anywhere on the Internet. Domain names were created to provide users with a simple location name, rather than requiring them to use a long list of numbers. For example, the IP number for the location of the THOMAS legislative system at the Library of Congress is 140.147.248.9; the corresponding domain name is thomas.loc.gov. Top Level Domains (TLDs) appear at the end of an address and are either a given country code, such as .jp or .uk, or are generic designations (gTLDs), such as .com, .org, .net, .edu, or .gov. The Domain Name System (DNS) is the distributed set of databases residing in computers around the world that contain the address numbers, mapped to corresponding domain names. Those computers, called root servers, must be coordinated to ensure connectivity across the Internet.

The Internet originated with research funding provided by the Department of Defense Advanced Research Projects Agency (DARPA) to establish a military network. As its use expanded, a civilian segment evolved with support from the National Science Foundation (NSF) and other science agencies. While there were (and are) no formal statutory authorities or international agreements governing the management and operation of the Internet and the DNS, several entities played key roles in the DNS. For example, the Internet Assigned Numbers Authority (IANA), which was operated at the Information Sciences Institute/University of Southern California under contract with the Department of Defense, made technical decisions concerning root servers, determined qualifications for applicants to manage country code TLDs, assigned unique protocol parameters, and managed the IP address space, including delegating blocks of addresses to registries around the world to assign to users in their geographic area.

NSF was responsible for registration of nonmilitary domain names, and in 1992 put out a solicitation for managing network services, including domain name registration. In 1993, NSF signed a five-year cooperative agreement with a consortium of companies called InterNic. Under this agreement, Network Solutions Inc. (NSI), a Herndon, VA, engineering and management consulting firm, became the sole Internet domain name registration service for registering the .com, .net., and .org. gTLDs.

After the imposition of registration fees in 1995, criticism of NSI’s sole control over registration of the gTLDs grew. In addition, there was an increase in trademark disputes arising out of the enormous growth of registrations in the .com domain. There also was concern that the role played by IANA lacked a legal foundation and required more permanence to ensure the stability of the Internet and the domain name system. These concerns prompted actions both in the United States and internationally.

An International Ad Hoc Committee (IAHC), a coalition of individuals representing various constituencies, released a proposal for the administration and management of gTLDs on February 4, 1997. The proposal recommended that seven new gTLDs be created and that additional registrars be selected to compete with each other in the granting of registration services for all new second level domain names. To assess whether the IAHC proposal should be supported by the U.S. government, the executive branch created an interagency group to address the domain

name issue and assigned lead responsibility to the National Telecommunications and Information Administration (NTIA) of the Department of Commerce (DOC). On June 5, 1998, DOC issued a final statement of policy, “Management of Internet Names and Addresses.” Called the White Paper, the statement indicated that the U.S. government was prepared to recognize and enter into agreement with “a new not-for-profit corporation formed by private sector Internet stakeholders to administer policy for the Internet name and address system.”¹ In deciding upon an entity with which to enter such an agreement, the U.S. government would assess whether the new system ensured stability, competition, private and bottom-up coordination, and fair representation of the Internet community as a whole.

The White Paper endorsed a process whereby the divergent interests of the Internet community would come together and decide how Internet names and addresses would be managed and administered. Accordingly, Internet constituencies from around the world held a series of meetings during the summer of 1998 to discuss how the New Corporation might be constituted and structured. Meanwhile, IANA, in collaboration with NSI, released a proposed set of bylaws and articles of incorporation. The proposed new corporation was called the Internet Corporation for Assigned Names and Numbers (ICANN). After five iterations, the final version of ICANN’s bylaws and articles of incorporation were submitted to the Department of Commerce on October 2, 1998. On November 25, 1998, DOC and ICANN signed an official Memorandum of Understanding (MOU), whereby DOC and ICANN agreed to jointly design, develop, and test the mechanisms, methods, and procedures necessary to transition management responsibility for DNS functions—including IANA—to a private-sector not-for-profit entity.

On September 17, 2003, ICANN and the Department of Commerce agreed to extend their MOU until September 30, 2006. The MOU specified transition tasks which ICANN agreed to address. On June 30, 2005, Michael Gallagher, then-Assistant Secretary of Commerce for Communications and Information and Administrator of NTIA, stated the U.S. government’s principles on the Internet’s domain name system. Specifically, NTIA stated that the U.S. government intends to preserve the security and stability of the DNS, that the United States would continue to authorize changes or modifications to the root zone, that governments have legitimate interests in the management of their country code top level domains, that ICANN is the appropriate technical manager of the DNS, and that dialogue related to Internet governance should continue in relevant multiple fora.²

On September 29, 2006, DOC announced a new Joint Project Agreement (JPA) with ICANN which was intended to continue the transition to the private sector of the coordination of technical functions relating to management of the DNS. The JPA extended through September 30, 2009, and focused on institutionalizing transparency and accountability mechanisms within ICANN. On September 30, 2009, DOC and ICANN announced agreement on an Affirmation of Commitments (AoC) to “institutionalize and memorialize” the technical coordination of the DNS globally and by a private-sector-led organization.³ The AoC affirms commitments made by DOC and ICANN to ensure accountability and transparency; preserve the security, stability, and resiliency of the

DNS; promote competition, consumer trust, and consumer choice; and promote international participation.

ICANN Basics

ICANN is a not-for-profit public benefit corporation headquartered in Marina del Rey, CA, and incorporated under the laws of the state of California. ICANN is organized under the California Nonprofit Public Benefit Law for charitable and public purposes, and as such, is subject to legal oversight by the California attorney general. ICANN has been granted tax-exempt status by the federal government and the state of California.⁴

ICANN's organizational structure consists of a Board of Directors (BOD) advised by a network of supporting organizations and advisory committees that represent various Internet constituencies and interests (see **Figure 1**). Policies are developed and issues are researched by these subgroups, who in turn advise the Board of Directors, which is responsible for making all final policy and operational decisions. The Board of Directors consists of 15 international and geographically diverse members, composed of one president, eight members selected by a Nominating Committee, two selected by the Generic Names Supporting Organization, two selected by the Address Supporting Organization, and two selected by the Country-Code Names Supporting Organization. Additionally, there are six non-voting liaisons representing other advisory committees.

The explosive growth of the Internet and domain name registration, along with increasing responsibilities in managing and operating the DNS, has led to marked growth of the ICANN budget, from revenues of about \$6 million and a staff of 14 in 2000, to revenues of \$65 million and a staff of about 130 in 2010. ICANN is funded primarily through fees paid to ICANN by registrars and registry operators. Registrars are companies (e.g., GoDaddy, Google, Network Solutions) with which consumers register domain names.⁵ Registry operators are companies and organizations who operate and administer the master database of all domain names registered in each top level domain (for example VeriSign, Inc. operates .com and .net, Public Interest Registry operates .org, and Neustar, Inc. operates .biz).⁶ In 2010, ICANN received 94% of its total revenues from registry and registrar fees (48% from registry fees, 46% from registrar fees).⁷

Issues in the 112th Congress

Congressional Committees (primarily the Senate Committee on Commerce, Science and Transportation and the House Committee on Energy and Commerce) maintain oversight on how the Department of Commerce manages and oversees ICANN's activities and policies. Other Committees, such as the House and Senate Judiciary Committees, maintain an interest in other issues affected by ICANN, such as intellectual property and privacy. Specific issues of Congressional interest include ICANN's relationship with the U.S. government and the international community, the proposal to add new generic top level domains, and privacy. The **Appendix** shows a complete listing of Congressional committee hearings on ICANN and the domain name system dating back to 1997.

Figure 1. Organizational Structure of ICANN

Source: ICANN (<http://www.icann.org/en/structure/>).

ICANN's Relationship with the U.S. Government

The Department of Commerce (DOC) has no statutory authority over ICANN or the DNS. However, because the Internet evolved from a network infrastructure created by the Department of Defense, the U.S. government originally owned and operated (primarily through private contractors such as the University of Southern California, SRI International, and Network Solutions Inc.) the key components of network architecture that enable the domain name system

to function. The 1998 Memorandum of Understanding between ICANN and the Department of Commerce initiated a process intended to transition technical DNS coordination and management functions to a private-sector not-for-profit entity. While the DOC plays no role in the internal governance or day-to-day operations of ICANN, the U.S. government, through the DOC, retains a role with respect to the DNS via three separate contractual agreements. These are

- the Affirmation of Commitments (AoC) between DOC and ICANN, which was signed on September 30, 2009;
- the contract between IANA/ICANN and DOC to perform various technical functions such as allocating IP address blocks, editing the root zone file, and coordinating the assignment of unique protocol numbers; and
- the cooperative agreement between DOC and VeriSign to manage and maintain the official DNS root zone file.

Affirmation of Commitments

On September 30, 2009, DOC and ICANN announced agreement on an Affirmation of Commitments (AoC) to “institutionalize and memorialize” the technical coordination of the DNS globally and by a private-sector-led organization.⁸ The AoC succeeds the concluded Joint Project Agreement (which in turn succeeded the Memorandum of Understanding between DOC and ICANN). The AoC has no expiration date and would conclude only if one of the two parties decided to terminate the agreement.

Buildup to the AoC

Various Internet stakeholders disagreed as to whether DOC should maintain control over ICANN after the impending JPA expiration on September 30, 2009. Many U.S. industry and public interest groups argued that ICANN was not yet sufficiently transparent and accountable, that U.S. government oversight and authority (e.g., DOC acting as a “steward” or “backstop” to ICANN) was necessary to prevent undue control of the DNS by international or foreign governmental bodies, and that continued DOC oversight was needed until full privatization is warranted. On the other hand, many international entities and groups from countries outside the United States argued that ICANN had sufficiently met conditions for privatization, and that continued U.S. government control over an international organization was not appropriate. In the 110th Congress, Senator Snowe introduced S.Res. 564 which stated the sense of the Senate that although ICANN had made progress in achieving the goals of accountability and transparency as directed by the JPA, more progress was needed.⁹

On April 24, 2009, NTIA issued a Notice of Inquiry (NOI) seeking public comment on the upcoming expiration of the JPA between DOC and ICANN.¹⁰ According to NTIA, a mid-term

⁸ Affirmation of Commitments by the United States Department of Commerce and the Internet Corporation for Assigned Names and Numbers, September 30, 2009, available at http://www.ntia.doc.gov/ntiahome/domainname/Affirmation_of_Commitments_2009.pdf.

⁹ In the 110th Congress, S.Res. 564 was referred to the Committee on Commerce, Science, and Transportation. It did not advance to the Senate floor.

¹⁰ Department of Commerce, National Telecommunications and Information Administration, “Assessment of the Transition of the Technical Coordination and Management of the Internet’s Domain Name and Addressing System,” 74 (continued...)

review showed that while some progress had been made, there remained key areas where further work was required to increase institutional confidence in ICANN. These areas included long-term stability, accountability, responsiveness, continued private-sector leadership, stakeholder participation, increased contract compliance, and enhanced competition. NTIA asked for public comments regarding the progress of transition of the technical coordination and management of the DNS to the private sector, as well as the model of private-sector leadership and bottom-up policy development which ICANN represents. Specifically, the NOI asked whether sufficient progress had been achieved for the transition to take place by September 30, 2009, and if not, what should be done.

On June 4, 2009, the House Committee on Energy and Commerce, Subcommittee on Communications, Technology, and the Internet, held a hearing examining the expiration of the JPA and other issues. Most members of the committee expressed the view that the JPA (or a similar agreement between DOC and ICANN) should be extended. Subsequently, on August 4, 2009, majority leadership and majority Members of the House Committee on Energy and Commerce sent a letter to the Secretary of Commerce urging that rather than replacing the JPA with additional JPAs, the DOC and ICANN should agree on a “permanent instrument” to “ensure that ICANN remains perpetually accountable to the public and to all of its global stakeholders.” According to the committee letter, the instrument should ensure the permanent continuance of the present DOC-ICANN relationship; provide for periodic reviews of ICANN performance; outline steps ICANN will take to maintain and improve its accountability; create a mechanism for implementation of the addition of new gTLDs and internationalized domain names; ensure that ICANN will adopt measures to maintain timely and public access to accurate and complete WHOIS information; and include commitments that ICANN will remain a not-for-profit corporation headquartered in the United States.

Critical Elements of the AoC

Under the AoC, ICANN commits to remain a not-for-profit corporation “headquartered in the United States of America with offices around the world to meet the needs of a global community.” According to the AoC, “ICANN is a private organization and nothing in this Affirmation should be construed as control by any one entity.”

Specifically, the AoC calls for the establishment of review panels which will periodically make recommendations to the ICANN Board in four areas:

- *Ensuring accountability, transparency and the interests of global Internet users*—the panel will evaluate ICANN governance and assess transparency, accountability, and responsiveness with respect to the public and the global Internet community. The panel will be composed of the Chair of ICANN’s Government Advisory Committee (GAC), the Chair of the Board of ICANN, the Assistant Secretary for Communications and Information of the Department of Commerce (i.e., the head of NTIA), representatives of the relevant ICANN Advisory Committees and Supporting Organizations, and independent experts. Composition of the panel will be agreed to jointly by the Chair of the GAC and the Chair of ICANN.

(...continued)

Federal Register 18688, April 24, 2009.

- *Preserving security, stability, and resiliency*—the panel will review ICANN’s plan to enhance the operational stability, reliability, resiliency, security, and global interoperability of the DNS. The panel will be composed of the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, and independent experts. Composition of the panel will be agreed to jointly by the Chair of the GAC and the CEO of ICANN.
- *Impact of new gTLDs*—starting one year after the introduction of new gTLDs, the panel will periodically examine the extent to which the introduction or expansion of gTLDs promotes competition, consumer trust, and consumer choice. The panel will be composed of the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, and independent experts. Composition of the panel will be agreed to jointly by the Chair of the GAC and the CEO of ICANN.
- *WHOIS policy*—the panel will review existing WHOIS policy and assess the extent to which that policy is effective and its implementation meets the legitimate needs of law enforcement and promotes consumer trust. The panel will be composed of the Chair of the GAC, the CEO of ICANN, representatives of the relevant Advisory Committees and Supporting Organizations, independent experts, representatives of the global law enforcement community, and global privacy experts. Composition of the panel will be agreed to jointly by the Chair of the GAC and the CEO of ICANN.

DOC Agreements with IANA and VeriSign

A contract between DOC and ICANN, which currently extends through September 30, 2011, authorizes the Internet Assigned Numbers Authority (IANA) to perform various technical functions such as allocating IP address blocks, editing the root zone file, and coordinating the assignment of unique protocol numbers. Additionally, a cooperative agreement between DOC and VeriSign (operator of the .com and .net registries) authorizes VeriSign to manage and maintain the official root zone file that is contained in the Internet’s root servers that underlie the functioning of the DNS.¹¹

By virtue of these legal agreements, the DOC has policy authority over the root zone file,¹² meaning that the U.S. government can approve or deny any changes or modifications made to the root zone file (changes, for example, such as adding a new top level domain). The June 30, 2005, U.S. government principles on the Internet’s domain name system stated the intention to “preserve the security and stability” of the DNS, and asserted that “the United States is committed to taking no action that would have the potential to adversely impact the effective and efficient

¹¹ “The root zone file defines the DNS. For all practical purposes, a top level domain (and, therefore, all of its lower-level domains) is in the DNS if and only if it is listed in the root zone file. Therefore, presence in the root determines which DNS domains are available on the Internet.” National Research Council, Committee on Internet Navigation and the Domain Name System: Technical Alternatives and Policy Implications, *Signposts on Cyberspace: The Domain Name System and Internet Navigation*, National Academy Press, Washington DC, 2005, p. 97.

¹² Milton Mueller, *Political Oversight of ICANN: A Briefing for the WSIS Summit*, Internet Governance Project, November 1, 2005, p. 4.

operation of the DNS and will therefore maintain its historic role in authorizing changes or modifications to the authoritative root zone file.”¹³

The JPA was separate and distinct from the DOC legal agreements with ICANN and VeriSign. As such, the expiration of the JPA and the establishment of the AoC did not directly affect U.S. government authority over the DNS root zone file. While ICANN has not advocated ending U.S. government authority over the root zone file, foreign governmental bodies have argued that it is inappropriate for the U.S. government to maintain exclusive authority over the DNS. The debate now shifts to negotiations over the renewal of the IANA contract between DOC and ICANN, which currently is due to expire on September 30, 2011.

ICANN and the International Community

Because cyberspace and the Internet transcend national boundaries, and because the successful functioning of the DNS relies on participating entities worldwide, ICANN is by definition an international organization. Both the ICANN Board of Directors and the various constituency groups who influence and shape ICANN policy decisions are composed of members from all over the world. However, many in the international community, including foreign governments, have argued that it is inappropriate for the U.S. government to maintain its legacy authority over ICANN and the DNS, and have suggested that management of the DNS should be accountable to a higher intergovernmental body.

The United Nations, at the December 2003 World Summit on the Information Society (WSIS), debated and agreed to study the issue of how to achieve greater international involvement in the governance of the Internet and the domain name system in particular. The study was conducted by the U.N.’s Working Group on Internet Governance (WGIG). On July 14, 2005, the WGIG released its report, stating that no single government should have a preeminent role in relation to international Internet governance. The report called for further internationalization of Internet governance, and proposed the creation of a new global forum for Internet stakeholders. Four possible models were put forth, including two involving the creation of new Internet governance bodies linked to the U.N. Under three of the four models, ICANN would either be supplanted or made accountable to a higher intergovernmental body. The report’s conclusions were scheduled to be considered during the second phase of the WSIS held in Tunis in November 2005. U.S. officials stated their opposition to transferring control and administration of the domain name system from ICANN to any international body. Similarly, the 109th Congress expressed its support for maintaining U.S. control over ICANN (H.Con.Res. 268 and S.Res. 323).¹⁴

The European Union (EU) initially supported the U.S. position. However, during September 2005 preparatory meetings, the EU seemingly shifted its support towards an approach which favored an enhanced international role in governing the Internet. Conflict at the WSIS Tunis Summit over control of the domain name system was averted by the announcement, on November 15, 2005, of an Internet governance agreement between the United States, the EU, and over 100 other nations. Under this agreement, ICANN and the United States remained in control of the domain name system. A new international group under the auspices of the U.N. was formed—the Internet Governance Forum (IGF)—which provides an ongoing forum for all stakeholders (both

¹³ See http://www.ntia.doc.gov/ntiahome/domainname/USDNSprinciples_06302005.pdf.

¹⁴ In the 109th Congress, H.Con.Res. 268 was passed unanimously by the House on November 16, 2005. S.Res. 323 was passed in the Senate by Unanimous Consent on November 18, 2005.

governments and nongovernmental groups) to discuss and debate Internet policy issues. The IGF does not have binding authority. It is slated to run through 2010, at which point the U.N. will consider whether and how to continue the body. Meanwhile, the U.N. is planning a WSIS Forum to be held in Geneva on May 16-20, 2011.¹⁵

Adding New Generic Top Level Domains (gTLDs)

Top Level Domains (TLDs) are the suffixes that appear at the end of an address (after the “dot”). TLDs can be either a country code such as .us, .uk, or .jp, or a generic TLD (gTLD) such as .com, .org, or .gov. Prior to ICANN’s establishment, there were eight gTLDs (.com, .org, .net, .gov, .mil, .edu, .int., and .arpa). In 2000 and 2004, ICANN held application rounds for new gTLDs; there are currently 21 gTLDs. Some are reserved or restricted to particular types of organizations (e.g., .museum, .gov, .travel) and others are open for registration by anyone (.com, .org, .info).¹⁶ Applicants for new gTLDs are typically commercial and non-profit organizations who seek to become ICANN-recognized registries that will establish and operate name servers for their TLD registry, as well as implement a domain name registration process for that particular TLD.

With the growth of the Internet and the accompanying growth in demand for domain names, debate has focused on whether and how to further expand the number of gTLDs. In October 2007, the Generic Names Supporting Organization (GNSO) approved a recommendation to initiate a process that could yield an indefinite number of new generic top-level domains. Although previous gTLD application rounds in 2000 and 2004 were competitions designed to award a limited number of gTLDs, the new process is intended to award gTLDs to any applicant that meets ICANN’s set criteria and that withstands any objections (if any) raised by outside parties. The result could be an unlimited number of new gTLDs, depending on the volume of applications.

The ICANN Board of Directors approved the GNSO recommendations in June 2008, and in October 2008, ICANN published a draft applicant guide book, available for public comment, which detailed how new gTLDs would be made available to applying prospective registries. Among the major criticisms raised in the public comments were the magnitude of ICANN’s suggested gTLD application and registry fees, and concerns over the impact of multiple new gTLDs on trademark holders who, many argued, would be compelled to assume high costs of addressing the possible proliferation of cybersquatters inhabiting an unlimited number of new gTLDs.

ICANN released a revised applicant guide book (“Second Draft Applicant Guidebook”) in February 2009. ICANN identified four particularly controversial and/or complex issues that “need more examination and discussion before they can be changed in a future draft guidebook.”¹⁷ These are security and stability, malicious conduct, trademark protection, and the need for a demand/economic analysis that examines whether additional gTLDs will result in increased competition and consumer choice.

¹⁵ See <http://www.itu.int/ws/is/implementation/2011/forum/>.

¹⁶ The 21 current gTLDs are listed at <http://www.iana.org/domains/root/db/#>.

¹⁷ ICANN, *New gTLD Draft Applicant Guidebook: Analysis of Public Comment*, February 18, 2009, p. 3, available at <http://www.icann.org/en/topics/new-gtlds/agv1-analysis-public-comments-18feb09-en.pdf>.

Regarding trademark protection, the ICANN board, on March 6, 2009, authorized the GNSO's Intellectual Property Constituency to form an Implementation Recommendation Team (IRT) to provide possible solutions to trademark issues raised by the implementation of new gTLDs.¹⁸ On May 29, the IRT released its recommendations for addressing trademark issues.¹⁹

The third Applicant Guidebook was released on October 4, 2009, for public comment, and the fourth Applicant Guidebook was released on May 10, 2010. On September 24-25, the Board of Directors met to discuss remaining new gTLD issues, including implementation of trademark protections, the new registry agreement terms, measures to mitigate malicious conduct, and ensuring root zone stability. The Board asked ICANN's staff to prepare additional working papers and a modified Applicant Guidebook for public review prior to ICANN's December meeting in Cartagena, Columbia. The proposed final Applicant Guidebook was released on November 10, 2010.²⁰

At the December 2010 meeting in Cartagena, Columbia, the ICANN Board considered procedural and substantive objections to the final Applicant Guidebook raised by the Government Advisory Committee (GAC).²¹ The Board announced its intention to meet with the GAC in February 2011 to resolve remaining concerns.²²

.xxx and Protecting Children on the Internet

Domain names have been viewed by some policymakers as a tool that could be used to protect children from obscene or indecent material on the Internet. In the 107th Congress, legislation was enacted to create a "kids-friendly top level domain name" that would contain only age-appropriate content. The Dot Kids Implementation and Efficiency Act of 2002 was signed into law on December 4, 2002 (P.L. 107-317), and authorized NTIA to require the .us registry operator (currently NeuStar) to establish, operate, and maintain a second level domain within the .us TLD that is restricted to material suitable for minors.

An opposite approach—establishing an adult content top level domain name that could be filtered by parents—has also been considered. In past Congresses, two bills were introduced to require the Department of Commerce to compel ICANN to establish a mandatory top level domain name (such as .xxx) for material that is deemed "harmful to minors." The bills were S. 2426 (109th Congress), which was introduced by Senator Baucus, and S. 2137 (107th Congress), which was introduced by Senator Landrieu. Neither of those bills advanced beyond introduction.

Meanwhile, as part of its process to add new generic top-level domains (gTLDs), ICANN has repeatedly considered (since 2000) whether to allow the establishment of a gTLD for adult content. On June 1, 2005, ICANN announced that it had entered into commercial and technical

¹⁸ See <http://www.icann.org/en/announcements/announcement-26mar09-en.htm>. The final report was released on May 29, 2009, and is available at <http://www.icann.org/en/announcements/announcement-4-29may09-en.htm>.

negotiations with a registry company (ICM Registry) to operate a new “.xxx” domain, which would be designated for use by adult websites. Registration by adult websites into the .xxx domain would be purely voluntary, and those sites would not be required to give up their existing (for the most part, .com) sites.

Announcement of a possible .xxx domain proved highly controversial. With the ICANN Board scheduled to consider final approval of the .xxx domain on August 16, 2005, the Department of Commerce sent a letter to ICANN requesting that adequate additional time be provided to allow ICANN to address the objections of individuals expressing concerns about the impact of pornography on families and children and opposing the creation of a new top level domain devoted to adult content. ICANN’s Governmental Advisory Committee (GAC) also requested more time before the final decision. At the March 2006 Board meeting in New Zealand, the ICANN Board authorized ICANN staff to continue negotiations with ICM Registry to address concerns raised by the DOC and the GAC. However, on May 10, 2006, the Board voted 9-5 against accepting the proposed agreement, but did not rule out accepting a revised agreement. Subsequently, on January 5, 2007, ICANN published for public comment a proposed revised agreement with ICM Registry to establish a .xxx domain. However, on March 30, 2007, the ICANN Board voted 9-5 to deny the .xxx domain, citing its reluctance to possibly assume an ongoing management and oversight role with respect to Internet content.²³

ICM Registry subsequently challenged ICANN’s decision before an Independent Review Panel (IRP), claiming that ICANN’s rejection of ICM’s application for a .xxx gTLD was not consistent with ICANN’s Articles of Incorporation and Bylaws. On February 19, 2010, the three-person Independent Review Panel (from the International Centre for Dispute Resolution) ruled primarily in favor of ICM Registry, finding that its application for the .xxx TLD had met the required criteria, and that the ICANN Board’s reversal of its initial approval “was not consistent with the application of neutral, objective and fair documented policy.”²⁴

The IRP decision was not binding; it is the ICANN Board of Directors’ decision to determine how to proceed and whether ICM’s application to operate a .xxx TLD should ultimately be approved. At ICANN’s March 2010 meeting in Nairobi, the Board voted to postpone any decision about the .xxx TLD, and directed ICANN’s CEO and general counsel to write a report examining possible options.²⁵

On June 25, 2010, at the ICANN meeting in Brussels, the Board voted to allow ICM’s .xxx application to move forward. The Board approved next steps for the application, including expedited due diligence by ICANN staff, negotiations between ICANN and ICM on a draft registry agreement, and consultation with ICANN’s Governmental Advisory Committee.

At the December ICANN meeting in Cartagena, Columbia, the ICANN Board passed a resolution stating that while “it intends to enter into a registry agreement with ICM Registry for the .xxx

TLD,” the Board will enter into a formal consultation with the Government Advisory Committee on areas where the Board’s decision is in conflict with GAC advice relating to the ICM application.²⁶

ICANN and Cybersecurity

The security and stability of the Internet has always been a preeminent goal of DNS operation and management. One issue of recent concern is an intrinsic vulnerability in the DNS which allows malicious parties to distribute false DNS information. Under this scenario, Internet users could be unknowingly redirected to fraudulent and deceptive websites established to collect passwords and sensitive account information.

A technology called DNS Security Extensions (DNSSEC) has been developed to mitigate those vulnerabilities. DNSSEC assures the validity of transmitted DNS addresses by digitally “signing” DNS data via electronic signature. “Signing the root” (deploying DNSSEC on the root zone) is a necessary first and critical step towards protecting against malicious attacks on the DNS.²⁷ On October 9, 2009, NTIA issued a Notice of Inquiry (NOI) seeking public comment on the deployment of DNSSEC into the Internet’s DNS infrastructure, including the authoritative root zone.²⁸ On June 3, 2009, NTIA and the National Institute of Standards and Technology (NIST) announced plans to work with ICANN and VeriSign to develop an interim approach for deploying DNSSEC in the root zone.²⁹ On June 9, 2010, NTIA filed a notice in the *Federal Register* seeking public comments on its testing and evaluation report and its intention to proceed with the final stages of domain name system security extensions implementation in the authoritative root zone.³⁰ On July 15, 2010, ICANN published the root zone trust anchor and root operators began to serve the signed root zone with actual keys, thereby making the signed root zone available.

Privacy and the WHOIS Database

Any person or entity who registers a domain name is required to provide contact information (phone number, address, email) which is entered into a public online database (the “WHOIS” database). The scope and accessibility of WHOIS database information has been an issue of contention. Privacy advocates have argued that access to such information should be limited, while many businesses, intellectual property interests, law enforcement agencies, and the U.S. government have argued that complete and accurate WHOIS information should continue to be publicly accessible. Over the past several years, ICANN has debated this issue through its Generic Names Supporting Organization (GNSO), which is developing policy recommendations

on what data should be publicly available through the WHOIS database. On April 12, 2006, the GNSO approved an official “working definition” for the purpose of the public display of WHOIS information. The GNSO supported a narrow technical definition favored by privacy advocates, registries, registrars, and non-commercial user constituencies, rather than a more expansive definition favored by intellectual property interests, business constituencies, Internet service providers, law enforcement agencies, and the Department of Commerce (through its participation in ICANN’s Governmental Advisory Committee). At ICANN’s June 2006 meeting, opponents of limiting access to WHOIS data continued urging ICANN to reconsider the working definition. On October 31, 2007, the GNSO voted to defer a decision on WHOIS database privacy and recommended more studies. The GNSO also rejected a proposal to allow Internet users the option of listing third party contact information rather than their own private data. Currently, the GNSO is exploring several extensive studies of WHOIS.³¹ Meanwhile, a review committee established by the Affirmation of Commitments began its first review of WHOIS policy on October 1, 2010.³²

Domain Names and Intellectual Property

Ever since the domain name system has been opened to commercial users, the ownership and registration of domain names has raised intellectual property concerns. The White Paper called upon the World Intellectual Property Organization (WIPO) to develop a set of recommendations for trademark/domain name dispute resolutions, and to submit those recommendations to ICANN. At ICANN’s August 1999 meeting in Santiago, the board of directors adopted a dispute resolution policy to be applied uniformly by all ICANN-accredited registrars. Under this policy, registrars receiving complaints will take no action until receiving instructions from the domain-name holder or an order of a court or arbitrator. An exception is made for “abusive registrations” (i.e., cybersquatting and cyberpiracy), whereby a special administrative procedure (conducted largely online by a neutral panel, lasting 45 days or less, and costing about \$1,000) will resolve the dispute. Implementation of ICANN’s Domain Name Dispute Resolution Policy commenced on December 9, 1999. Meanwhile, the 106th Congress passed the Anticybersquatting Consumer Protection Act (incorporated into P.L. 106-113, the FY2000 Consolidated Appropriations Act). The act gives courts the authority to order the forfeiture, cancellation, and/or transfer of domain names registered in “bad faith” that are identical or similar to trademarks, and provides for statutory civil damages of at least \$1,000, but not more than \$100,000, per domain name identifier.

Domain names have also recently been viewed as a possible way to address piracy of online content. In the 111th Congress, S. 3804, the Combating Online Infringement and Counterfeits Act (COICA), would give the Department of Justice authority to seek a court order to compel domestic registries and registrars to suspend the operation of domain names used by Internet sites dedicated to infringing activities. In the case of domains for which the registry or registrar is not located domestically, S. 3804 would give the Department of Justice authority to seek a court order to compel domestic Internet service providers to impair the functionality of the domain name used by infringing Internet sites.

Concluding Observations

Many of the technical, operational, and management decisions regarding the DNS can have significant impacts on Internet-related policy issues such as intellectual property, privacy, e-commerce, and cybersecurity. As such, decisions made by ICANN affect Internet stakeholders around the world. In transferring management of the DNS to the private sector, the key policy question has always been how to best ensure achievement of the White Paper principles: Internet stability and security, competition, private and bottom-up policymaking and coordination, and fair representation of the global Internet community. What is the best process to ensure these goals, and how should various stakeholders—companies, institutions, individuals, governments—fit into this process?

ICANN has established governance processes that are intended to give access to Internet stakeholders into important decisions. With the expiration of the ICANN-DOC Joint Project Agreement on September 30, 2009, and with the subsequent implementation of the Affirmation of Commitments, the 112th Congress and the Administration may examine whether those processes are sufficient to give the full range of Internet stakeholders meaningful input into ICANN decisions, and whether ICANN is sufficiently accountable to those Internet stakeholders.³³

A related issue is whether the U.S. government's unique authority over the DNS root zone should continue indefinitely. Foreign governments have argued that it is inappropriate for the U.S. government to have exclusive authority over the worldwide DNS, and that technical coordination and management of the DNS should be accountable to international governmental entities. On the other hand, many U.S. officials argue that it is critical for the U.S. government to maintain authority over the DNS in order to guarantee the stability and security of the Internet.

Meanwhile, the Affirmation of Commitments establishes a mechanism to review ICANN activities and policies regarding new gTLDs, DNS security and stability, and the WHOIS database. Ultimately, how these issues are addressed could have profound impacts on the continuing evolution of ICANN, the DNS, and the Internet.

³³ ICANN has established internal accountability mechanisms (an Ombudsman, a Reconsideration Committee, and an independent review process) which are intended to address complaints and disputes over ICANN decisions. See http://www.icann.org/en/general/accountability_review.html.
