Internet Privacy: Overview and Pending Legislation

Updated July 6, 2004

Marcia S. Smith

Resources, Science, and Industry Division
Summary

Internet privacy issues generally encompass two types of concerns. One is the collection of personally identifiable information (PII) by website operators from visitors to government and commercial websites, or by software that is surreptitiously installed on a user’s computer (“spyware”) and transmits the information to someone else. The other is the monitoring of electronic mail and Web usage by the government or law enforcement officials, employers, or Internet Service Providers.

The September 11, 2001 terrorist attacks intensified debate over the issue of law enforcement monitoring, with some advocating increased tools for law enforcement to track down terrorists, and others cautioning that fundamental tenets of democracy, such as privacy, not be endangered in that pursuit. Congress passed the 2001 USA PATRIOT Act (P.L. 107-56) that, inter alia, makes it easier for law enforcement to monitor Internet activities. That act was later amended by the Homeland Security Act (P.L. 107-296), loosening restrictions as to when, and to whom, Internet Service Providers can voluntarily release information about subscribers if they believe there is a danger of death or injury. Privacy advocates are monitoring how the act is implemented. Legislation is pending regarding whether to add, or remove, “sunset” provisions for certain sections of the act.

The debate over website information policies concerns whether industry self regulation or legislation is the best approach to protecting consumer privacy. Congress has considered legislation that would require commercial website operators to follow certain fair information practices, but none has passed. Legislation has passed, however, regarding information practices for federal government websites e.g., the E-Government Act (P.L. 107-347). Meanwhile, controversy is rising about how to protect computer users from spyware without creating unintended consequences. Spyware is not well defined, but generally includes software emplaced on a computer without the user’s knowledge that takes control of the computer away from the user, such as by redirecting the computer to unintended websites, causing advertisements to appear, or collecting information and transmitting it to another person. Four spyware bills are pending; one (H.R. 2929) has been ordered reported from committee.

Identity theft is not an Internet privacy issue, but is often debated in the context of whether the Internet makes identity theft more prevalent. Thus, it is briefly discussed in this report. For more information on that topic, see CRS Report RL31919, Remedies Available to Victims of Identity Theft, and CRS Report RL32121, Fair Credit Reporting Act: A Side-by-Side Comparison of House, Senate and Conference Versions.

This report provides an overview of Internet privacy, tracks Internet privacy legislation pending before the 108th Congress, and describes the laws that were enacted in the 107th Congress. For information on wireless privacy issues, see CRS Report RL31636, Wireless Privacy: Availability of Location Information for Telemarketing. This report will be updated.

Internet Privacy: Overview and Pending Legislation

Introduction

Internet privacy issues encompass concerns about the collection of personally identifiable information (PII) from visitors to government and commercial websites, as well as debate over law enforcement or employer monitoring of electronic mail and Web usage. This report discusses Internet privacy issues and tracks pending legislation. More information on Internet privacy issues is available in CRS Report RL30784, Internet Privacy: An Analysis of Technology and Policy Issues, and CRS Report RL31289, The Internet and the USA PATRIOT Act: Potential Implications for Electronic Privacy, Security, Commerce, and Government.

Internet: Commercial Website Practices

One aspect of the Internet (“online”) privacy debate focuses on whether industry self regulation or legislation is the best route to assure consumer privacy protection. In particular, consumers appear concerned about the extent to which website operators collect “personally identifiable information” (PII) and share that data with third parties without their knowledge. Repeated media stories about privacy violations by website operators have kept the issue in the forefront of public debate about the Internet. Although many in Congress and the Clinton Administration preferred industry self regulation, the 105th Congress passed legislation (COPPA, see below) to protect the privacy of children under 13 as they use commercial websites. Many bills have been introduced since that time regarding protection of those not covered by COPPA, but the only legislation that has passed concerns federal government, not commercial, websites.

Children’s Online Privacy Protection Act (COPPA), P.L. 105-277

Congress, the Clinton Administration, and the Federal Trade Commission (FTC) initially focused their attention on protecting the privacy of children under 13 as they visit commercial websites. Not only are there concerns about information children might divulge about themselves, but also about their parents. The result was the Children’s Online Privacy Protection Act (COPPA), Title XIII of Division C of the FY1999 Omnibus Consolidated and Emergency Supplemental Appropriations Act, P.L. 105-277. The FTC’s final rule implementing the law became effective April 21, 2000 [http://www.ftc.gov/os/1999/10/64fr59888.htm]. Commercial websites and online services directed to children under 13, or that knowingly collect information from them, must inform parents of their information practices and obtain verifiable
parental consent before collecting, using, or disclosing personal information from children. The law also provides for industry groups or others to develop self-regulatory “safe harbor” guidelines that, if approved by the FTC, can be used by websites to comply with the law. The FTC approved self-regulatory guidelines proposed by the Better Business Bureau on January 26, 2001. FTC Chairman Muris stated in testimony to the Senate Commerce Committee on June 11, 2003 that the FTC had brought eight COPPA cases, and obtained agreements requiring payment of civil penalties totaling more than $350,000.1

FTC Activities and Fair Information Practices

The FTC has conducted or sponsored several website surveys since 1997 to determine the extent to which commercial website operators abide by four fair information practices—providing notice to users of their information practices before collecting personal information, allowing users choice as to whether and how personal information is used, allowing users access to data collected and the ability to contest its accuracy, and ensuring security of the information from unauthorized use. Some include enforcement as a fifth fair information practice. Regarding choice, the term “opt-in” refers to a requirement that a consumer give affirmative consent to an information practice, while “opt-out” means that permission is assumed unless the consumer indicates otherwise. See CRS Report RL30784 for more information on the FTC surveys and fair information practices. The FTC’s reports are available on its website [http://www.ftc.gov].

Briefly, the first two FTC surveys (December 1997 and June 1998) created concern about the information practices of websites directed at children and led to the enactment of COPPA (see above). The FTC continued monitoring websites to determine if legislation was needed for those not covered by COPPA. In 1999, the FTC concluded that more legislation was not needed at that time because of indications of progress by industry at self-regulation, including creation of “seal” programs (see below) and by two surveys conducted by Georgetown University. However, in May 2000, the FTC changed its mind following another survey that found only 20% of randomly visited websites and 42% of the 100 most popular websites had implemented all four fair information practices. The FTC voted to recommend that Congress pass legislation requiring websites to adhere to the four fair information practices, but the 3-2 vote indicated division within the Commission. On October 4, 2001, FTC’s new chairman, Timothy Muris, revealed his position on the issue, saying that he did not see a need for additional legislation now.

Advocates of Self Regulation

In 1998, members of the online industry formed the Online Privacy Alliance (OPA) to encourage industry self regulation. OPA developed a set of privacy guidelines, and its members are required to adopt and implement posted privacy policies. The Better Business Bureau (BBB), TRUSTe, and WebTrust have established “seals” for websites. To display a seal from one of those organizations, a website operator must agree to abide by certain privacy principles (some of which

---

are based on the OPA guidelines), a complaint resolution process, and to being monitored for compliance. Advocates of self regulation argue that these seal programs demonstrate industry’s ability to police itself.

Technological solutions also are being offered. P3P (Platform for Privacy Preferences) is one often-mentioned technology. It gives individuals the option to allow their web browser to match the privacy policies of websites they access with the user’s selected privacy preferences. Its goal is to put privacy in the hands of the consumer. P3P is one of industry’s attempts to protect privacy for online users. Josh Freed from the Internet Education Foundation says there is strong private sector backing for P3P as a first step in creating a common dialogue on privacy, and support from Congress, the Administration, and the FTC as well (see the IEF website [http://www.p3ptoolbox.org/tools/papers/IEFP3POutreachforDMA.ppt]). The CATO Institute, argues that privacy-protecting technologies are quite effective [http://www.cato.org/pubs/briefs/bp-065es.html]. However, complaints are arising from some industry participants as P3P is implemented. One concern is that P3P requires companies to produce shortened versions of their privacy policies to enable them to be machine-readable. To some, this raises issues of whether the shortened policies are legally binding, since they may omit nuances, and “sacrifice accuracy for brevity.”

**Advocates of Legislation**

Consumer, privacy rights and other interest groups believe self regulation is insufficient. They argue that the seal programs do not carry the weight of law, and that while a site may disclose its privacy policy, that does not necessarily equate to having a policy that protects privacy. The Center for Democracy and Technology (CDT, at [http://www.cdt.org]) and the Electronic Privacy Information Center (EPIC, at [http://www.epic.org]) each have released reports on this topic. TRUSTe and BBBOnline have been criticized for becoming corporate apologists rather than defenders of privacy. In the case of TRUSTe, for example, Esther Dyson, who is credited with playing a central role in the establishment of the seal program, reportedly is disappointed with it. Wired.com reported in April 2002 that “Dyson agreed that...Truste’s image has slipped from consumer advocate to corporate apologist. ‘The board ended up being a little too corporate, and didn’t have any moral courage,’ she said.” Truste subsequently announced plans to strengthen its seal program by more stringent licensing requirements and increased monitoring of compliance.

Some privacy interest groups, such as EPIC, also feel that P3P is insufficient, arguing that it is too complex and confusing and fails to address many privacy issues. An EPIC report from June 2000 further explains its findings [http://www.epic.org/reports/prettypoorprivacy.html].

Privacy advocates are particularly concerned about online profiling, where companies collect data about what websites are visited by a particular user and

---

develop profiles of that user’s preferences and interests for targeted advertising. Following a one-day workshop on online profiling, FTC issued a two-part report in the summer of 2000 that also heralded the announcement by a group of companies that collect such data, the Network Advertising Initiative (NAI), of self-regulatory principles. At that time, the FTC nonetheless called on Congress to enact legislation to ensure consumer privacy vis a vis online profiling because of concern that “bad actors” and others might not follow the self-regulatory guidelines. As noted, the current FTC Chairman’s position is that broad legislation is not needed at this time.

107th Congress Action

Many Internet privacy bills were considered by, but did not clear, the 107th Congress. H.R. 89, H.R. 237, H.R. 347, and S. 2201 dealt specifically with commercial website practices. H.R. 4678 was a broader consumer privacy protection bill. The Bankruptcy Reform bill (H.R. 333/S. 420) would have prohibited (with exceptions) companies, including website operators, that file for bankruptcy from selling or leasing PII obtained in accordance with a policy that said such information would not be transferred to third parties, if that policy was in effect at the time of the bankruptcy filing. H.R. 2135 would have limited the disclosure of personal information (defined as PII and sensitive personal information) by information recipients in general, and S. 1055 would have limited the commercial sale and marketing of PII. In a related measure, S. 2839 sought to protect the privacy of children using elementary or secondary school or library computers that use “Internet content management services,” such as filtering software to restrict access to certain websites.

During the second session of the 107th Congress, attention focused on S. 2201 (Hollings) and H.R. 4678 (Stearns). (H.R. 4678 has been reintroduced in the 108th Congress, see below.) A fundamental difference was that H.R. 4678 affected privacy for both “online” and “offline” data collection entities, while S. 2201’s focus was online privacy. During markup by the Senate Commerce Committee, a section was added to S. 2201 directing the FTC to issue recommendations and propose regulations regarding entities other than those that are online. Other amendments also were adopted. The bill was reported on August 1, 2002 (S.Rept. 107-240). A House Energy and Commerce subcommittee held a hearing on H.R. 4678 on September 24, 2002. There was no further action on either bill.

Legislation in the 108th Congress

Representative Frelinghuysen introduced H.R. 69 on the opening day of the 108th Congress. The bill would require the FTC to prescribe regulations to protect the privacy of personal information collected from and about individuals not covered by COPPA

On April 3, 2003, Representative Stearns introduced H.R. 1636, which is similar to H.R. 4678 from the 107th Congress. It addresses privacy for both online and offline entities. Its major provisions are shown in Table 1.
Table 1: Major Provisions of H.R. 1636 (Stearns)

FTC = Federal Trade Commission  
GAO = General Accounting Office  
PII = Personally Identifiable Information

Senator Feinstein introduced S. 745 on March 31, 2003. Title 1 of that bill requires commercial entities to provide notice and choice (opt-out) to individuals regarding the collection and disclosure or sale of their PII, with exceptions. She also introduced S. 1350 on June 26, 2003, which would require federal agencies and persons engaged in interstate commerce, who possess electronic data containing personal information, to disclose any unauthorized acquisition of that data. A Senate Judiciary subcommittee held a hearing on S. 1350 in November 2003.

### Internet: Federal Government Website Information Practices

Under a May 1998 directive from President Clinton and a June 1999 Office of Management and Budget (OMB) memorandum, federal agencies must ensure that their information practices adhere to the 1974 Privacy Act. In June 2000, however, the Clinton White House revealed that contractors for the Office of National Drug Control Policy (ONDCP) had been using “cookies” (small text files placed on users’ computers when they access a particular website) to collect information about those using an ONDCP site during an anti-drug campaign. ONDCP was directed to cease using cookies, and OMB issued another memorandum reminding agencies to post and comply with privacy policies, and detailing the limited circumstances under which agencies should collect personal information. A September 5, 2000 letter from OMB to the Department of Commerce further clarified that “persistent”cookies, which remain on a user’s computer for varying lengths of time (from hours to years), are not allowed unless four specific conditions are met. “Session” cookies, which expire when the user exits the browser, are permitted.

At the time, Congress was considering whether commercial websites should be required to abide by FTC’s four fair information practices. The incident sparked interest in whether federal websites should adhere to the same requirements. In the
FY2001 Transportation Appropriations Act (P.L. 106-346), Congress prohibited funds in the FY2001 Treasury-Postal Appropriations Act from being used to collect, review, or create aggregate lists that include PII about an individual’s access to or use of a federal website or enter into agreements with third parties to do so, with exceptions. Similar language is in the FY2002 Treasury-Postal Appropriations Act (P.L. 107-67). The FY2003 Treasury-Postal appropriations bills (sec. 634 in both H.R. 5120 and S. 2740) also contained similar language, though the bill did not clear the 107th Congress.

Section 646 of the FY2001 Treasury-Postal Appropriations Act (P.L. 106-554) required Inspectors General (IGs) to report to Congress on activities by those agencies or departments relating to their own collection of PII, or entering into agreements with third parties to obtain PII about use of websites. Then-Senator Fred Thompson released two reports in April and June 2001 based on the findings of agency IGs who discovered unauthorized persistent cookies and other violations of government privacy guidelines on several agency websites. An April 2001 GAO report (GAO-01-424) concluded that most of the 65 sites it reviewed were following OMB’s guidance.

The 107th Congress passed the E-Government Act (P.L. 107-347), which sets requirements on government agencies regarding how they assure the privacy of personal information in government information systems and establish guidelines for privacy policies for federal websites. The law requires federal websites to include a privacy notice that addresses what information is to be collected, why, its intended use, what notice or opportunities for consent are available to individuals regarding what is collected and how it is shared, how the information will be secured, and the rights of individuals under the 1974 Privacy Act and other relevant laws. It also requires federal agencies to translate their website privacy policies into a standardized machine-readable format, enabling P3P to work (see above discussion of P3P), for example. According to a February 2004 Federal Computer Week article, agency implementation of that provision is proceeding slowly.3

Monitoring of E-mail and Web Usage

By Government and Law Enforcement Officials

Another concern is the extent to which electronic mail (e-mail) exchanges or visits to websites may be monitored by law enforcement agencies or employers. In the wake of the September 11 terrorist attacks, the debate over law enforcement monitoring has intensified. Previously, the issue had focused on the extent to which the Federal Bureau of Investigation (FBI), with legal authorization, uses a software program, called Carnivore (later renamed DCS 1000), to intercept e-mail and monitor Web activities of certain suspects. The FBI installs the software on the equipment of Internet Service Providers (ISPs). Privacy advocates are concerned whether Carnivore-like systems can differentiate between e-mail and Internet usage by a

---

subject of an investigation and similar usage by other people. Section 305 of the 21st Century Department of Justice Appropriations Authorization Act (P.L. 107-273) required the Justice Department to report to Congress at the end of FY2002 and FY2003 on its use of Carnivore/DCS 1000 or any similar system.

On the other hand, following the terrorist attacks, Congress passed the Uniting and Strengthening America by Providing Appropriate Tools to Intercept and Obstruct Terrorism (USA PATRIOT) Act (P.L. 107-56), which expands law enforcement’s ability to monitor Internet activities. *Inter alia*, the law modifies the definitions of “pen registers” and “trap and trace devices” to include devices that monitor addressing and routing information for Internet communications. Carnivore-like programs may now fit within the new definitions. The Internet privacy-related provisions of the USA PATRIOT Act, included as part of Title II, are as follows:

- **Section 210**, which expands the scope of subpoenas for records of electronic communications to include records commonly associated with Internet usage, such as session times and duration.

- **Section 212**, which allows ISPs to divulge records or other information (but not the contents of communications) pertaining to a subscriber if they believe there is immediate danger of death or serious physical injury or as otherwise authorized, and requires them to divulge such records or information (excluding contents of communications) to a governmental entity under certain conditions. It also allows an ISP to divulge the contents of communications to a law enforcement agency if it reasonably believes that an emergency involving immediate danger of death or serious physical injury requires disclosure of the information without delay. [*This section was amended by the Homeland Security Act, see below.*]

- **Section 216**, which adds routing and addressing information (used in Internet communications) to dialing information, expanding what information a government agency may capture using pen registers and trap and trace devices as authorized by a court order, while excluding the content of any wire or electronic communications. The section also requires law enforcement officials to keep certain records when they use their own pen registers or trap and trace devices and to provide those records to the court that issued the order within 30 days of expiration of the order. To the extent that Carnivore-like systems fall within the new definition of pen registers or trap and trace devices provided in the act, that language would increase judicial oversight of the use of such systems.

- **Section 217**, which allows a person acting under color of law to intercept the wire or electronic communications of a computer trespasser transmitted to, through, or from a protected computer under certain circumstances, and
Section 224, which sets a four-year sunset period for many of the Title II provisions. Among the sections excluded from the sunset are Sections 210 and 216.

The Cyber Security Enhancement Act, section 225 of the Homeland Security Act (P.L. 107-296), amends section 212 of the USA PATRIOT Act. It lowers the threshold for when ISPs may voluntarily divulge the content of communications. Now ISPs need only a “good faith” (instead of a “reasonable”) belief that there is an emergency involving danger (instead of “immediate” danger) of death or serious physical injury. The contents can be disclosed to “a Federal, state, or local governmental entity” (instead of a “law enforcement agency”).

Privacy advocates are especially concerned about the new language added by the Cyber Security Enhancement Act. EPIC notes, for example, that allowing the contents of Internet communications to be disclosed voluntarily to any governmental entity not only poses increased risk to personal privacy, but also is a poor security strategy. Another concern is that the law does not provide for judicial oversight of the use of these procedures.

S. 1695 (Leahy) would amend the PATRIOT Act to provide more oversight. *Inter alia,* it would amend the sunset provision (Sec. 224) such that all of the above cited sections would terminate on December 31, 2005, including Sections 210 and 216, which currently are not subject to the sunset clause. S. 1709 (Craig) would amend the USA PATRIOT Act, *inter alia,* to include Sec. 216 in the sunset clause. By contrast, S. 2476 (Kyl), would repeal Sec. 224 so that none of the provisions sunset.

**By Employers**

There also is concern about the extent to which employers monitor the e-mail and other computer activities of employees. The public policy concern appears to be not whether companies should be able to monitor activity, but whether they should notify their employees of that monitoring. A 2003 survey by the American Management Association [http://www.amanet.org/research/index.htm] found that 52% of the companies surveyed engage in some form of e-mail monitoring. A September 2002 General Accounting Office report (GAO-02-717) found that, of the 14 Fortune 1,000 companies it surveyed, all had computer-use policies, and all stored employee’s electronic transactions, e-mail, information on websites visited, and computer file activity. Eight of the companies said they would read and review those transactions if they received other information than an individual might have violated company policies, and six said they routinely analyze employee’s transactions to find possible inappropriate uses.

---

4 The language originated as H.R. 3482, which passed the House on June 15, 2002.

By E-Mail Service Providers

In what is widely-regarded as a landmark ruling concerning Internet privacy, the U.S. Court of Appeals for the First Circuit in Massachusetts ruled (2-1) on June 29, 2004 that an e-mail service provider did not violate federal wiretapping statutes when it intercepted and read subscribers’ e-mails to obtain a competitive business advantage. The ruling upheld the decision of a lower court to dismiss the case.

The case involved an e-mail service provider, Interloc, Inc., that sold out-of-print books. According to press accounts and the text of the court’s ruling, Interloc used software code to intercept and copy e-mail messages sent to its subscribers (who were dealers looking for buyers of rare and out-of-print books) by competitor Amazon.com. The e-mail was intercepted and copied prior to its delivery to the recipient so that Interloc officials could read the e-mails and obtain a competitive advantage over Amazon.com. Interloc Vice President Bradford Councilman was charged with violating the Wiretap Act. The court’s majority opinion noted that the parties stipulated that, at all times that the Interloc software was performing operations on the e-mails, they existed in the random access memory or in hard drives within Interloc’s computer system.

The case turned on the distinction between the e-mail being in transit, or in storage (and therefore governed by a different law). The government argued that the e-mails were copied contemporaneously with their transmission, and therefore were intercepted under the meaning of the Wiretap Act. Judges Torruella and Cyr concluded, however, that they were in temporary storage in Interloc’s computer system, and therefore were not subject to the provisions of the Wiretap Act. They further stated that “We believe that the language of the statute makes clear that Congress meant to give lesser protection to electronic communications than wire and oral communication. Moreover, at this juncture, much of the protection may have been eviscerated by the realities of modern technology.... However, it is not the province of this court to graft meaning onto the statute where Congress has spoken plainly.” (p. 14-15). In his dissent, Judge Lipez stated, conversely, that he did not believe Congress intended for e-mail that is temporarily stored as part of the transmission process to have less privacy than messages as they are in transit. He agreed with the government’s contention that an “intercept” occurs between the time

---

9 According to Jewell, op. cit., two other defendants—Alibris, which bought Interloc in 1998, and Interloc’s systems administrator—pleaded guilty.

10 Stored communications are covered by the Stored Communications Act, which is Title II of ECPA, 18 U.S.C. §§ 2701-2711.
the author hits the “send” button and the message arrives in the recipient’s in-box. He concluded that “Councilman’s approach to the Wiretap Act would undo decades of practice and precedent ... and would essentially render the act irrelevant .... Since I find it inconceivable that Congress could have intended such a result merely by omitting the term ‘electronic storage’ from its definition of ‘electronic communication,’ I respectfully dissent.”

Privacy advocates expressed deep concern about the ruling. Electronic Frontier Foundation (EFF) attorney Kevin Bankston stated that the court had “effectively given Internet communications providers free rein to invade the privacy of their users for any reason and at any time.” The five major ISPs (AOL, Earthlink, Microsoft, Comcast, and Yahoo) all reportedly have policies governing their terms of service that state that they do not read subscribers’ e-mail or disclose personal information unless required to do so by law enforcement agencies.

Spyware

What is Spyware?

The term “spyware” is not well defined. Jerry Berman, President of the Center for Democracy and Technology (CDT), explained in testimony to the Senate Commerce Committee in March 2004 that “The term has been applied to software ranging from ‘keystroke loggers’ that capture every key typed on a particular computer; to advertising applications that track users’ web browsing; to programs that hijack users’ system settings.” He noted that what these various types of software programs “have in common is a lack of transparency and an absence of respect for users’ ability to control their own computers and Internet connections.” The FTC held a workshop on spyware on April 19, 2004.

One example of spyware is software products that include, as part of the software itself, a method by which information is collected about the use of the computer on which the software is installed. Some products may collect personally identifiable information (PII). When the computer is connected to the Internet, the software periodically relays the information back to the software manufacturer or a marketing company. Some spyware traces a user’s Web activity and causes advertisements to suddenly appear on the user’s monitor — called “pop-up” ads — in response. Software programs that include spyware can be sold or provided for free, on a disk (or other media) or downloaded from the Internet. Typically, users have no knowledge that spyware is on their computers.

---

11 U.S. v Bradford C. Councilman, p. 53.
13 Krim, op. cit.
As noted, spyware also can refer to “keylogging” software that records a person’s keystrokes. All typed information thus can be obtained by another party, even if the author modifies or deletes what was written, or if the characters do not appear on the monitor (such as when entering a password). Commercial key logging software has been available for some time, but its existence was highlighted in 2001 when the FBI, with a search warrant, installed the software on a suspect’s computer, allowing them to obtain his password for an encryption program he used, and thereby evidence. Some privacy advocates argue wiretapping authority should have been obtained, but the judge, after reviewing classified information about how the software works, ruled in favor of the FBI. Press reports also indicate that the FBI is developing a “Magic Lantern” program that performs a similar task, but can be installed on a suspect’s computer remotely by surreptitiously including it in an e-mail message, for example. Privacy advocates question what type of legal authorization should be required.

### 108th Congress Spyware Legislation

Four spyware bills are pending before the 108th Congress, of which one, H.R. 2929, has been acted upon in committee.

**H.R. 2929** (Bono) was ordered reported from the House Energy and Commerce Committee on June 24, 2004, after adoption of a substitute version offered by Representative Stearns. The text of the Stearns substitute, called the **SPY ACT** (Securely Protect Yourself Against Cyber Trespass Act), is available at [http://energycommerce.house.gov/108/Markups/06242004/ains_fc_xml.pdf]. As ordered reported, the act, which would expire on December 31, 2009, includes the following provisions.

Section 2, which would become effective on the date the law is enacted, prohibits deceptive acts or practices relating to spyware. It would be unlawful for anyone who is not the owner or authorized user (hereafter, the user) of a protected computer to —

- take control of the computer by utilizing the computer to send unsolicited information or material from the computer to others, diverting the computer’s browser away from the site the user intended to view, accessing or using the computer’s Internet connection and thereby damaging the computer or causing the user to incur unauthorized financial charges, using the computer as part of an activity performed by a group of computers that causes damage to another computer, or delivering advertisements that a user cannot close without turning off the computer or closing all sessions of the Internet browser;
- modify settings related to use of the computer or the computer’s access to the Internet by altering the Web page that appears when the browser is launched, the default provider used to access or search the Internet, the list of bookmarks, or security or other settings that protect information about the user;
- collect personally identifiable information through keylogging;
- induce the user to install software, or prevent reasonable efforts to block the installation or execution of, or to disable, software, by presenting the
user with an option to decline installation but the installation nevertheless
proceeds, or causing software that has been properly removed or disabled
to automatically reinstall or reactivate;
→ misrepresent that certain actions or information is needed to open, view,
or play a particular type of content;
→ misrepresent the identity or authority of a person or entity providing
software in order to induce the user to install or execute the software;
→ misrepresent the identity or authority of a person seeking information in
order to induce the user to provide personally identifiable information (this
practice is commonly called “phishing”);
→ remove, disable, or render inoperative security, anti-spyware, or anti-virus
technology installed on the computer;
→ install or execute on the computer one or more additional software
components with the intent of causing a person to use such component in
a way that violates any other provision of this section.

Section 3 prohibits the collection of certain information without notice and
consent. It contains an opt-in requirement, wherein it would be unlawful for anyone
to transmit any information collection program, or execute any information collection
functions installed on a computer, without obtaining consent from the user before the
information collection program is executed for the first time. “Information collection
program” is defined as software the collects personally identifiable information and
sends it to a person other than the user, or uses such information to deliver or display
advertising; or collects information regarding Web pages accessed using the
computer and uses such information to deliver or display advertising. The bill
specifies certain requirements for notice (differentiating among various types of
software at issue) and consent. If multiple collection programs first execute any of
the information collection functions of the programs together, only one notice is
required. However, the user must be notified and consent obtained if the information
collected or sent is materially changed. Users must be able to disable or remove the
information collection program without undue effort or knowledge. Telecommunications
 carriers, information service or interactive computer service
providers, cable operators, or providers of transmission capability are not liable under
the act. Section 3 would become effective one year after the law is enacted, and
would not apply to information collection programs installed on a computer prior to
that date.

The Federal Trade Commission is directed to enforce the act, and is either
directed or permitted to promulgate rules for various sections. Civil penalties are set
for various violations. Exceptions are made for a variety of law enforcement/national
security-related activities, and for network providers that use monitoring software to
protect network security and prevent fraud. The act would supersede state laws that
expressly regulate deceptive conduct similar to that described in the act, or the
transmission or execution of a computer program similar to that described in the act,
or the use of context-based triggering mechanisms or similar means to display
advertisements. It would not preempt other state trespass, contract, or tort laws, or
other state laws to the extent they relate to fraud.

The Stearns substitute reportedly responded to industry concerns about earlier
versions of the legislation, but some Members and lobbyists continue to express
reservations, and further changes are possible before the bill reaches the House floor.15

Three other bills are pending.

- **H.R. 4255 (Inslee), the Computer Software Privacy and Control Act,** requires notice to and consent of a user before anyone installs software on a user’s computer (not including pre-installed software, and certain other exceptions) that collects certain information about the owner or operator of the computer and transmits it to anyone other than the owner or operator; that modifies the operation of the computer without the consent of the owner or operator and without including a removal utility; or that delivers or displays advertisements without the consent of the owner or operator and without including a removal utility. Referred to the House Energy & Commerce and House Judiciary Committees.

- **H.R. 4661 (Goodlatte), the I-SPY Prevention Act,** creates criminal penalties for certain spyware practices: up to five-years in prison for anyone using software to intentionally break into a computer and use the software in furtherance of another federal crimes; and up to two years in prison for anyone using software to intentionally break into a computer and then altering the computer’s security settings or obtaining personal information with the intent to defraud or injure a person, or with the intent to damage a computer. Referred to the House Judiciary Committee.

- **S. 2145 (Burns-Wyden), the SPY BLOCK (Software Principles Yielding Better Levels of Consumer Knowledge) Act,** requires notice to and consent of a user before anyone installs software on a user’s computer (not including pre-installed software, and certain other exceptions). It also requires the user’s affirmative consent to each information collection feature, advertising feature, distributed computing feature, and setting modification feature in the software. The software also must be able to be easily uninstalled. Referred to the Commerce, Science, and Transportation Committee; hearing held March 23, 2004.

**Arguments For and Against Legislation**

The Senate Commerce Committee’s Communications Subcommittee held a hearing on S. 2145 on March 23, 2004. Witnesses discussed the difficulties in legislating in an area where definitions are unclear, and the pace of technology might quickly render any such definitions obsolete. Mr. Robert Holleyman, representing

---

the Business Software Alliance, testified that the focus of legislation should be regulating bad behavior, not technology. He expressed reservations about S. 2145, and called on Congress not to preclude the evolution of tools and marketplace solutions to the problem. Mr. John L. Levine, author of *The Internet for Dummies* and similar books, concluded that the legislation should ban spyware banned entirely, or consumers should be able to give a one-time permanent notice (akin to the telemarketing Do Not Call list) that they do not want spyware on their computers. He also said that the legislation should allow consumers to sue violators, rather than relying only on the FTC and state Attorneys General to enforce the law. Mr. Berman of CDT noted that three existing laws (including the FTC Act) can be used to address spyware concerns, and that technology measures, self-regulation and user education also are important to dealing with spyware. He concluded that CDT believes that new legislation specifically targeted at spyware would be useful, but that Congress also should pass broad Internet privacy legislation that could address the privacy aspects of the spyware debate.

While there is concern generally about any software product installed without the user’s knowledge or consent, one particular area of controversy is programs that cause pop-up ads to appear. Many users object to pop-up ads as vigorously as they do to unsolicited commercial e-mail (“spam” — see CRS Report RL31953). The extent to which pop-up ads are, or should be, included in a definition of spyware was discussed at the Senate Commerce Committee hearing. Mr Avi Naider, President and CEO of WhenU.com, argued that although his company’s WhenU software does create pop-up ads, it is not spyware because users are notified that the program is about to be installed, must affirmatively consent to a license agreement, and may decline it. Mr. Naider explained that his program often is “bundled” with software that users obtain for free (called “free-ware”), or a software developer may offer users a choice between paying for the software or obtaining it for free if they agree to receive ads from WhenU. While agreeing that spyware is a serious concern, and that Congress and the FTC should regulate in this area, Mr. Naider urged that legislation be written carefully to exclude products like his that offer notice and choice and therefore should not be considered spyware. As noted below, WhenU has filed suit against a Utah law regulating spyware.

The House Energy and Commerce’s Subcommittee on Telecommunications and the Internet held a hearing on April 29, 2004. At the hearing, FTC representatives argued that many of the actions under the rubric of “spyware” already are illegal, and additional legislation is not needed and could have unintended consequences because of the difficulty in defining spyware. A CDT witness again argued in favor of broad privacy legislation rather than focusing only on spyware. A representative from Earthlink supported legislation. A witness from Microsoft said that his company supports a “holistic” solution, but did not clearly state whether he supported new legislation or not.
Utah’s Spyware Law

On March 23, 2004, the Governor of Utah signed an anti-spyware law, which became effective on May 3, 2004. The definition of spyware in that law includes certain pop-up ads. It prohibits, for example, some pop-up ads that partially or wholly cover or obscure paid advertising or other content on a website in a way that interferes with a user’s ability to view the website. A media report stated that passage of the law was “driven by a Utah company in a legal fight with a pop-up company.” The Utah law also defines spyware, inter alia, as software installed on a computer without the user’s consent and that cannot be easily disabled and removed. Several high-tech companies reportedly argued that the law could have unintended consequences, for example, prohibiting parents from installing software to block access by their children to certain Websites because the software monitors Web activities, may have been installed without the child’s consent, and the child may not be able to uninstall it easily.

WhenU filed suit against the Utah law on constitutional grounds, and Utah legislators reportedly are considering modifications to the law. The Third Judicial District Court in Salt Lake City, Utah granted a preliminary injunction on June 22, 2004, preventing the law from taking effect. As noted above, H.R. 2929 would supersede state spyware laws.

Identity Theft

Identity theft is not an Internet privacy issue, but the perception that the Internet makes identity theft easier means that it is often discussed in the Internet privacy context. The concern is that the widespread use of computers for storing and transmitting information is contributing to the rising rates of identity theft, where one individual assumes the identity of another using personal information such as credit card and Social Security numbers (SSNs). The FTC has a toll free number (877-ID-THEFT) to help victims.

---

Whether the Internet is responsible for the increase in cases is debatable. Some attribute the rise instead to carelessness by businesses in handling personally identifiable information, and by credit issuers that grant credit without proper checks. In a 2003 survey for the FTC, Synovate found that 51% of victims do not know how their personal information was obtained by the thief; 14% said their information was obtained from lost or stolen wallets, checkbooks, or credit cards; 13% said the personal information was obtained during a transaction; 4% cited stolen mail; and 14% said the thief used “other” means (e.g. the information was misused by someone who had access to it such as a family member or workplace associate).22

Several laws have been passed regarding identity theft (P.L. 105-318, P.L. 106-433, and P.L. 106-578), but Congress continues to assess ways to reduce the incidence of identity theft and help victims.

On December 4, 2003, the President signed the most recent law, the Fair and Accurate Credit Transactions Act (H.R. 2622, P.L. 108-159). It is discussed in detail in CRS Report RL32121, Fair Credit Reporting Act: A Side-By-Side Comparison of House, Senate, and Conference Versions. Among its identity theft-related provisions, the law —

- requires consumer reporting agencies to follow certain procedures concerning when to place, and what to do in response to, fraud alerts on consumers’ credit files;
- allows consumers one free copy of their consumer report each year from nationwide consumer reporting agencies as long as the consumer requests it through a centralized source under rules to be established by the FTC;23
- allows consumers one free copy of their consumer report each year from nationwide specialty consumer reporting agencies (medical records or payments, residential or tenant history, check writing history, employment history, and insurance claims) upon request pursuant to regulations to be established by the FTC;14
- requires credit card issuers to follow certain procedures if additional cards are requested within 30 days of a change of address notification for the same account;
- requires the truncation of credit card numbers on electronically printed receipts;
- requires business entities to provide records evidencing transactions alleged to be the result of identity theft to the victim and to law enforcement.

---

23 The FTC rules on free credit reports were issued on June 4, 2004 and are available at [http://www.ftc.gov/opa/2004/06/freeannual.htm].
enforcement agencies authorized by the victim to take receipt of the records in question;

- requires consumer reporting agencies to block the reporting of information in a consumer’s file that resulted from identity theft and to notify the furnisher of the information in question that it may be the result of identity theft;

- requires federal banking agencies, the FTC, and the National Credit Union Administration to jointly develop guidelines for use by financial institutions, creditors and other users of consumer reports regarding identity theft;

- extends the statute of limitations for when identity theft cases can be brought; and

- allows consumers to request that the first five digits of their Social Security Numbers not be included on a credit report provided to the consumer by a consumer reporting agency.

A number of other bills have been introduced in the 108th Congress regarding identity theft and protection of Social Security Numbers. They are described in Table 2 below. One, H.R. 1731, has passed the House and Senate. It makes aggravated identity theft in conjunction with felonies a crime, and establishes mandatory sentences — 2 additional years beyond the penalty for the underlying crime, or 5 additional years for those who steal identities in conjunction with a terrorist act.24

---

Summary of Pending 108th Congress Legislation

The following table summarizes legislation pending before the 108th Congress concerning Internet privacy and identity theft (including protection of Social Security Numbers).

### Table 2: Pending Internet Privacy-Related Legislation
